VOLUME III ISSUE V • Devoted to the 68XX User • May 1981
"Small Computers Doing Big Things"

SERVING THE 68XX USER WORLDWIDE

YOUR CHOICE-smart either way

- Over 140 software driven functions
- 82 x 24 or 82 x 20 screen format — software selectable
- High resolution 7 x 12 matrix characters — P-31 green phosphor
- Upper/lower case character set — plus graphics character set
- 56-key alphanumeric keyboard — plus 12-key cursor, numeric pad
- Internal editing functions — insert, delete, scroll, roll, slide, etc.
- Parallel printer I/O port
- 50 to 38,400 baud operation — programmable
- Cursor type, cursor position, print control characters, protected fields, shift inversion, dual intensity and many other features

8212 — twelve-inch diagonal screen or **8209** — nine-inch diagonal screen

 219 W. RHAPSODY
 SAN ANTONIO, TEXAS 78216 (512) 344-0241

UniFLEX™

Multi-User

UniFLEX is the first full capability multi-user operating system available for microprocessors. Designed for the 6809 and 68000, it offers its users a very friendly computing environment. After a user 'logs-in' with his user name and password, any of the system programs may be run at will. One user may run the text editor while another runs BASIC and still another runs the C compiler. Each user operates in his own system environment, unaware of other user activity. The total number of users is only restricted by the resources and efficiency of the hardware in use.

Multi-Tasking

UniFLEX is a true multi-tasking operating system. Not only may several users run different programs, but one user may run several programs at a time. For example, a compilation of one file could be initiated while simultaneously making changes to another file using the text editor. New tasks are generated in the system by the 'fork' operation. Tasks may be run in the background or 'locked' in main memory to assist critical response times. Inter-task communication is also supported through the 'pipe' mechanism.

Support

The design of UniFLEX, with its hierarchical file system and device independent I/O, allows the creation of a variety of complex support programs. There is currently a wide variety of software available and under development. Included in this list is a Text Processing System for word processing functions, BASIC interpreter and precompiler for general programming and educational use, native C and Pascal compilers for more advanced programming, sort/merge for business applications, and a variety of debug packages. The standard system includes a text editor, assembler, and about forty utility programs. UniFLEX for 6809 is sold with a single CPU license and one year maintenance for \$450.00. Additional yearly maintenance is available for \$100.00. OEM licenses are also available.

FLEX™

UniFLEX is offered for the advanced microprocessor systems. FLEX, the industry standard for 6800 and 6809 systems, is offered for smaller, single user systems. A full line of FLEX support software and OEM licenses are also available.

----- —ITEMS SUBMITTED FOR PUBLICATION—

(Letters to the Editor for Publication) All letters to the Editor should be substantiated by facts. Opinions should be indicated as such. All letters must be signed. We are interested in receiving letters that will benefit or alert our readers. Praise as well as gripes is always good subject matter. Your name may be withheld upon request. If you have had a good experience with a 6800 vendor please put it in a letter. If the experience was bad put that in a letter also. Remember, if you tell us who they are then it is only fair that your name not be withheld. This means that all letters published, of a critical nature, cannot have a name withheld. We will attempt to publish 'verbatim' letters that are composed using 'good taste.' We reserve the right to define (for '68' Micro) what constitutes 'good taste.'

(Articles and items submitted for publication) Please, always include your full name, address, and telephone number. Date and number all sheets. TYPE them if you can, poorly handwritten copy is sometimes the difference between go, no-go. All items should be on 8X11 inch, white paper. Most all art work will be reproduced photographically, this includes all listings, diagrams and other non-text material. All typewritten copy should be done with a NEW RIBBON. All hand drawn art should be black on white paper. Please no hand written code items over 50 bytes. Neatly typed copy will be directly reproduced. Column width should be 3¼ inches.

(Advertising) Any Classified: Maximum 20 words. All single letters and/or numbers will be considered one (1) word. No Commercial or Business Type Classified advertising. Classified ads will be published in our standard format. Classified ads \$7.50 one time run, paid in advance.

Commercial and/or Business advertisers please write or phone for current rate sheet and publication lag time.

GIMIX 2MHZ 6809 PLUS 32K SYSTEM

IDEAL FOR SOFTWARE DEVELOPMENT

- You can order a system to meet your needs or select the one featured below.
- INCLUDES:** 6809 plus CPU #05, Mainframe Cabinet, Mother Board, Power Supply, Fan, 2 Port Serial Card & Cables, 2 Disk Regulator Cards, and 32KB Static Ram. . . **\$2194.89**
- For 50 Hz Export Power Supply, add **\$30.00**
- You can add as much memory as you need, e.g., 24K additional Ram to bring you up to 56K is \$438.14 more.
- 6800 CPU'S AND SYSTEMS ALSO AVAILABLE.

DUAL DRIVE 5 1/4" Disk Systems For Use In GIMIX Mainframes.

- All Systems include:* Disk Controller, Cable, and GIMIX version of TSC'S Flex.
- Power for the drives is provided by the C.V. power supply in the GIMIX Mainframe and 2 of our disk regulator boards. This gives your disk system the same brownout protection and power supply reliability as the rest of the system.
- When ordered with a GIMIX 6809 system, GIMIXBUG 09 and Boot Prom is also included, or, subject to availability, you may substitute Microware's OS-9 for the GIMIXBUG/FLEX combination at no charge, or have both. Software Selectable installed on the CPU, for **\$150.00 Additional**.
- Systems using Uniflex or Video based will also be available.**
- To substitute the GIMIX DMA Controller for the #28, Add \$200.00 to the Double Density chart.

SINGLE DENSITY 2 DRIVE SYSTEM USING OUR #48 DISK CONTROLLER

WITH	CAPACITY IN BYTES		PRICE
	FORMATTED	UNFORMATTED	
2-40 Track (48TPI) Single Sided	199,680	250,000	\$ 998.00
2-40 Track (48TPI) Double Sided	399,360	500,000	1198.00
2-80 Track (96TPI) Single Sided	404,480	500,000	1198.00
2-80 Track (96TPI) Double Sided	808,960	1,000,000	1598.00

DOUBLE DENSITY 2 DRIVE SYSTEMS USING OUR #28 DISK CONTROLLER

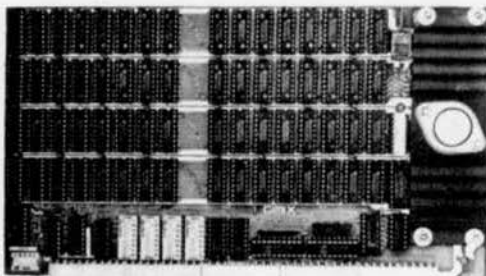

WITH	CAPACITY IN BYTES		PRICE
	FORMATTED	UNFORMATTED	
2-40 Track (48TPI) Single Sided	341,424	500,000	\$1148.00
2-40 Track (48TPI) Double Sided	718,848	1,000,000	1348.00
2-80 Track (96TPI) Single Sided	728,064	1,000,000	1348.00

THE CLASSY CHASSIS \$998.19

32K STATIC RAM BOARDS

Designed for use with:

- ★ Existing SS50 Systems
- ★ SS50C Extended Address Systems

- Assembled
- Burned In
- Tested

16K . . . \$328.12

24K . . . \$438.14

32K . . . \$548.15

16K and 24K Versions are socketed for 32K and require only additional 2114's for expansion.

FEATURES:

- Decoding for 4 Extended Address Lines (allows memory decoding up to 1 megabyte)
- DIP-switch to set extended addressing or disable it
- 4 separate 8K blocks, addressable to any 8K boundary by DIP-switch
- Each 8K block may be individually disabled
- Write protect either of two 16K sections
- Low power consumption — uses 2114L low power RAMS
- Fully Socketed
- Gold Bus Connectors
- Guaranteed 2MHz operation

To Substitute CMOS RAM, add \$100.00 for 16K, \$150.00 for 24K, \$200.00 for 32K.

TO ORDER BY MAIL

SEND CHECK OR MONEY ORDER OR USE YOUR VISA OR MASTER CHARGE
Please allow 3 weeks for personal checks to clear

U.S. orders add \$5 handling if order is under \$200.00. Foreign orders add \$10 handling if order is under \$200.00.

Foreign orders over \$200.00 will be shipped via Emery Air Freight @COLLECT, and we will charge no handling. All orders must be prepaid in U.S. funds. Please note that foreign checks have been taking about 8 weeks for collection so we would advise wiring money, or checks drawn on a bank account in the U.S. Our bank is the Continental Illinois National Bank of Chicago, account #73-32033. Visa or Master Charge also accepted.

GIMIX inc. reserves the right to change pricing and product specifications at any time without further notice.

GIMIX® and GHOST® are registered trademarks of GIMIX inc. © 1980 GIMIX inc.

Flex and Uniflex are trademarks of Technical Systems Consultants Inc. OS-9 is a trademark of Microware Inc. See their ads for other GIMIX compatible software.

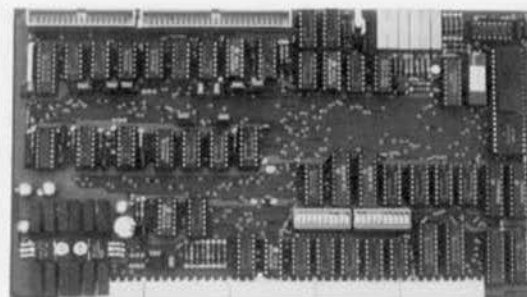

I/O BOARDS

for the 30 PIN BUS:

- 1 Port Serial (RS 232 or 20MA, current loop) **\$ 88.41**
- 2 Port RS 232 Serial **128.43**
- 2 Port Parallel **88.42**

for the 50 PIN BUS:

- 8 Port RS 232 Serial **288.40**
- 8 Port RS 232 Serial with on board Baud Rate generator **318.46**
- 8 Port Parallel **198.45**

The GIMIX DMA DISK CONTROLLER (\$548.68) uses high speed Direct Memory Access (DMA) for data transfers to and from system memory. It supports any combination of drives, 8" and 5"; single and double headed; single and double track (48 and 96 TPI); single and double density; up to 4 drives total. The board features both a phase-locked loop data separator and adjustable write precompensation to insure high reliability, and can be used in 6809 systems running at 1, 1.5, and 2 MHz.

Available software includes GIMIX versions of the 6809 FLEX disk operating system, \$90.00. OS-9 and UniFLEX will also be available.

BASIC09™

has a dual personality.

**One
craves
meat-and-
potatoes
BASIC.**

**The
other
prefers
Programme
ala Pascal.**

Some people say BASIC09 is really a PASCAL in disguise, others say it's still BASIC. You'll understand this delightful dilemma when you look at both versions of the "bubble sort" program shown below: both can be run by BASIC09. The program on top is unstructured and hard to understand, but it's traditional BASIC. The program on the bottom is well-structured and easy to follow, a virtue of PASCAL. With BASIC09 you can program either way, or mix the best of both. It's like getting two languages for the price of one.

SORT AN ARRAY IN ASCENDING SEQUENCE

```
90 DIM A(5)
100 I=5
110 IF I=1 THEN 200
120 FOR J=1 TO I-1
130 IF A(J)<A(J+1) THEN 170
140 T=A(J+1)
150 A(J+1)=A(J)
160 A(J)=T
170 NEXT J
180 I=I-1
190 GOTO 110
200 RETURN
```

```
DIM array(5)
outer=5
WHILE outer>1 DO
  outer=outer-1
  FOR inner=1 TO outer
    IF array(inner)>array(inner+1) THEN
      temp=array(inner+1)
      array(inner+1)=array(inner)
      array(inner)=temp
    ENDIF
  NEXT inner
ENDWHILE
RETURN
```

Makes programs better

BASIC09 has five kinds of loop structures: WHILE . . DO, REPEAT . . UNTIL,

LOOP . . ENDOOP, FOR . . NEXT and IF . . THEN . . ELSE. If one of the five built-in data types (byte, integer, real, string, and boolean) doesn't suit the problem, you can make a new one of your liking with the TYPE statement. Need a tree, linked list, or symbol table? Complex non-rectangular data structures using any combination of data types are easy to define. Modular programming breaks down large programs to smaller, more manageable elements. BASIC09 lets you create independent program modules called "procedures" with local variables for recursion plus parameter passing to any other BASIC09 or machine language procedure. There is a complete set of statements for device-independent sequential or random I/O, plus a superlative PRINT USING system.

Makes programs faster

No full-feature BASIC for any 8-bit microprocessor is faster than BASIC09, because it is an interactive compiler. As each program line is entered, it is instantly compiled to a smaller, faster form. Because BASIC09 automatically converts programs back to original "source" form for listing, it is as friendly and easy-to-use as traditional interpreter BASICs. Each procedure can be independently compiled to position-independent, reentrant, ROMable format. Microware® developed a new ultra-fast 9-digit-accuracy floating point math system just for BASIC09. And if that's still

not fast enough, there's BYTE and INTEGER arithmetic.

Features that make programs easier to write

The compiler is integrated with a full-feature string AND line-number oriented text editor. If you make a mistake, BASIC09 tells you instantly. String-oriented commands such as search, change, change all occurrences, delete, and insert can be used on programs with or without line numbers. There's an automatic line renumbering function too.

Features that make programs easy to test

Debugging often takes longer than writing a program. That's why BASIC09's integral high-level debugger sets it apart from all other compiled OR interpretive languages. The TRACE command shows you each statement executed in BASIC form, plus the result of any expression evaluation. STEP lets you run one or more statements at a time. LET and PRINT allow you to examine or change the values of variables, by name. STATE lists procedure calling order. And there are nine other debug commands. If you need to correct a program, you can edit, recompile, and rerun it in seconds.

Microware® software is available for most popular 6409 computer systems. Source listings and yearly maintenance update service are sold separately for most programs.

Write or call for our free catalog. We accept phone orders and MasterCard and VISA orders.

Does timesharing on a small system make sense?

It does with OS-9™ Level One!

Now two (or more) acts can share your microcomputer stage. You will no longer have to walk away from your computer while it is busy running a long program. Because OS-9 is a multitasking operating system, you can be running a BASIC program while editing a PASCAL program, for example. This lets you make more efficient use of your time and your system, even if you only use one terminal. If your application requires multiple, independent terminals, one OS-9 system can do the work of several single-user systems.

The convenience of an advanced operating system

Sophistication does not require complexity. Many OS-9 users say that it is actually easier to use than the older 6800-type operating systems. Consider how easy it is to run multiple programs: to run a program you just type its name and hit 'return.' To run a program as a separate job, you type its name, an '&' character, then hit return. The program runs as usual, but OS-9 comes back immediately and is ready for your next command. Simple commands let you see each program's status, set its priority, or abort it.

The file management system has fast, byte-addressable random and sequential-access files. The tree-structured multiple directory system lets you create separate disk directories for each user, project, or

application. Command line I/O file redirection means you specify what device and/or files a program will use when you run it, not when you write it.

Efficiency and hardware versatility

No other operating system can run on such a broad range of hardware: the overall RAM requirement for Level One is 32K to 56K RAM. Memory utilization is superlative because OS-9 lets multiple tasks "share" the same reentrant program. For example, if two users run BASIC09, only one "copy" is actually loaded into memory. The Level Two version of OS-9 can utilize up to a megabyte of memory on systems having memory management hardware (both versions come with complete timesharing support).

OS-9's device independent I/O system can handle almost any number and combination of I/O

devices: five or eight inch diskettes, winchester disks, disk cartridges, serial and parallel ports, memory-mapped video displays, and more.

Microware® offers a large selection of "stock" device interface software modules, or you can create your own: all the information you need is in the manuals.

Excellent support and documentation

Each OS-9 package comes with a User's Manual and a System Programmer's Manual that cover every aspect of OS-9. If you have special requirements, you can even purchase the Source Code for most of OS-9 and related software. At Microware® we take pride in offering the best customer support in the business. Technical advice and assistance by phone, mail or telex is available during all business hours.

Superb software tools

In addition to BASIC09, Microware® offers: an Interactive Assembler, Macro Text Editor, Stylograph Word Processor, Interactive Debugger, and coming soon, COBOL, PASCAL, and C language compilers.

Microware® software is available for most popular 6809 computer systems. Source listings and yearly maintenance update service are sold separately for most programs.

Please call or write for our free catalog. We accept phone orders and MasterCard and VISA orders.

FOR THE 800'S

X-FORTH FLEX COMPATIBLE FORTH

X-FORTH is the best FORTH there is for 6809/6800 computers running FLEX! There's no better way to put it, X-FORTH beats the competition hands down and here's why.

FLEX COMPATIBLE

She can read and write FLEX random and sequential files. She can even read and write the sequential files RANDOMLY! Uses FLEX I/O for terminal and printer. Honors TTYSET.

TWO EDITORS

She has a TTY editor modeled after the FORTH INC. editor rather than the FIG version. She has a FULL SCREEN EDITOR for terminals that support cursor addressing.

STANDARD ASSEMBLER

She uses standard MOTOROLA mnemonics thus: 'LDA [44]' becomes '[44] LDA' in X-FORTH. 6809 assembler also supports 6800 mnemonics!

ERROR CONTROL

You the programmer have complete control over disk related errors while other errors provide long error messages. X-FORTH has a protected dictionary and is very hard to accidentally crash!

String primitives, Complete DATA FILE VOCABULARY, Triple precision math package, Portability between 6800 and 6809 versions of X-FORTH. Compatible with FIG FORTH. AND, THERE'S EVEN MORE WE DON'T HAVE ROOM TO LIST!

Supplied on one 8" Disk or 2, 5" disk(s) with a 200 page manual in a hard cover binder. Disk(s) have the source of everything but the core X-FORTH, which will be available later at extra cost. You get it all!!!

By Charles (Chuck) Eaker, Ph.D

FANTASTIC DOCUMENTATION (We're very proud of this)

4 PART HARD BOUND MANUAL (approx. 200 pages)

1... GOING FORTH

Tutorial on the use of FORTH that makes it a snap to learn!!

2... GOING X-FORTH

X-FORTH extensions and FLEX interface.

Shows you what the 'X' in X-FORTH is all about!

3... USER'S MANUAL AND DOCUMENTATION

This is the main part of X-FORTH with sections on: math operations, stacks, input words, output words, strings, disk I/O, edit, editor, assembler, utilities, etc. All grouped by function for ease of use!

4... GLOSSARIES AND SOURCE LISTINGS

2 glossaries. 1 sorted by function and the other alphabetically. Source of all but the core of X-FORTH (also included on disk!)

APPENDIX INCLUDES

Discussion on how to extend the compiler.

BASIC language to FORTH examples and discussion.

Plus more!

We wanted to provide a better FORTH with more extras at less cost and we did it!!! Here it is!

All for only

Manual available separately for \$39.95, with credit for later purchase. **\$129.95**

WHAT ARE YOU WAITING FOR ...

New Price

JCP

Job Control Program
By Peter Murray

The JOB CONTROL PROGRAM (JCP) reads a text file that contains the necessary input for a program and then supplies this input to the program in the same manner that an operator would have normally entered it from the keyboard. A procedure file contains input for such calling programs as FLEX™, FLEX™ utility commands, and other development software. JCP is used as a FLEX™ command within a procedure to load and execute another procedure. 6809 MICRO DISK (100K) version. Each disk is a whole piece of software comes along with the package. A Quantum™ disk is the store of all such a program is JCP.

See Review in July 80 68 MICRO
OBJECT ONLY \$49.95
WITH SOURCE ON DISK \$89.95
6800 UPGRADE TO 6809 \$29.95

SOFTWARE

READTEST

English Text Analysis Program
By Dale Puckett

READTEST is a must for all writers and writing instructors. Reads prose from disk file and tells how well it was written. Reports number of lines, words, sentences, paragraph words, all used, average sentence length, individual reports paragraph trouble areas. Overall index tells who can read it and who would prefer it. Fast 6809 object code. Runs in FLEX™ 68 MICRO DISK (100K) version. Each disk is a whole piece of software comes along with the package. A Quantum™ disk is the store of all such a program is READTEST.

See Review in August 80 68 MICRO
INCLUDES SOURCE ON DISK

BASICO935

FOR 6809 ONLY

This Basic will execute programs originally written for SWTPC 33 Basic. (You use your old manual). Also included are three utilities: Set, Report, Hex, On Error, Erroroff, Auto, Exit, and Run. Runs 60% faster because of optimized code (not relocatable). Includes disk with manual of added features.

PRICE \$54.05

PRICE \$49.95

REMOTE

Intelligent Terminal Program
By Tom Speer

REMOTE allows use of 6800 or 6809 system as a remote computer. Gives you access to time sharing systems designed for home computer users. With a MICRONET or INE SOURCE. All you need is your FLEX™ based 6809 disk drive, a terminal interface, a modem, and REMOTE. REMOTE will support the New Terminal Systems Modem Card. INCLUDES SOURCE ON DISK.

PRICE \$39.95

ESTHER

An exercise in artificial intelligence
By Dale Puckett

ESTHER is a plus. Artificial intelligence program. 6809 object code. ESTHER is a name, a girl, a person, a player, a name, and even a set of words. ESTHER identifies more than 75 keywords and uses almost 100 sets of replies. ESTHER features a word length and unit in FLEX™. She obeys TTYSET. She is both educational and fun.

INCLUDES SOURCE ON DISK

PRICE \$39.95

SOFTWARE

Dataman DATABASE MANAGEMENT

16 menu driven programs make up a complete sequential DBMS system. Easy to use, yet very powerful. Define your database with the 'CREATE' program, then do complete file maintenance and database manipulation easily. Move records from one database to another. Even merge two unlike databases into a new one. Both vertical and horizontal report formats. Horizontal report formats are saved with run-time options available. Label printing module and 'PR' file build module for use with TSC Text Processor. Uses TSC Sort/Merge package for fast sorts on up to 20 keys. Statistics report program module gives up to 24 statistical values. You define the range of records to be used only once, then run the modules desired. Uses 'SYSTEM.GEN' file to configure system to any system terminal or printer. Easy to modify and customize with 'SHELL' program to allow easy program writing. Comes with every line of source code, program and variable descriptions, and 166 page ring bound manual.

\$149.95

Datarand **NEW**

The first add-on package to the DATAMAN DBMS allows creation of random files from DATAMAN database files using multiple keys! DATARAND files allow super fast look-up and editing of records. DATARAND files can be converted back to DATAMAN files. Very easy to use. No need to worry about Sector Blocking. DATARAND can use any database regardless of the size of the records or the number of fields! No ISAM key files to search. Great for on-line inventories, real time directories, etc. Complete with all source code and manual.

\$49.95

**THE ONLY DBMS AVAILABLE THAT
ALLOWS ANY SIZE RECORDS AND
ANY NUMBER OF FIELDS!**

For most people, spending money for a printer with capabilities they'll never use just doesn't make sense. That's why we designed the MX-70. The MX-70 is the lowest-priced 80-column dot matrix printer on the market today. But it's still one fine little printer. In fact, the MX-70 has features that, until recently, you couldn't buy at any price.

One of the family.
 The MX-70 is one of the Epson MX Series of printers. It shares technology based on years of intensive research and development. Its patented, disposable print head prints between 50 and 100 million characters. When it wears out, just throw it away. It's user-replaceable at about 1/3 the cost of standard print heads. Our precision plastic injection molded case eliminates most costly hand assembly, which keeps the price low and the quality high.

Everything you need.
 The MX-70 prints unidirectionally at 80 CTS with a user-defined choice of 40 (double-width characters) or 80-column printing. It gives you top of

forms recognition, programmable line feed and form lengths, an easy-to-load 5x7 matrix, self test, and an adjustable tractor feed. And because it's a true impact printer, it doesn't need extra aluminum or thermal paper, plain paper is just fine. And we give you graphics at no extra charge.

No-fills printing at a no-fills price.
 If you want a simple, no-fills printer, if you don't want to buy features you'll never use, if you want a reliable printer backed by the world's largest manufacturer of print mechanisms, we're afraid there's only one logical choice.

SPELLING LESSONS

Programmers are no different than people in other professions when it comes to spelling. (Lousy). Here are a few of my unfavorable mailings of words found commonly in source listings. The word is mnemonic pronounced nemonik, e as in men o as in on i as in pick. It is not numonic, nor is it mnumonic. It is not pronounced newmonik as it would have to be if it were spelled either of those wrong ways. The word Parameter is frequently abbreviated in a comment. Many programmers like PARMs for that. It should be PARAMS or PAR'MS with the apostrophe to indicate the letter left out. When a programmer can't think of more examples for his comment, he ends it with a Latin word meaning and so forth. The word is etcetra, and the abbreviation is etc. and not ect. I write this, so I try a little harder to spell things correctly, though I'm sure that now I will receive 100 letters pointing out that I make errors too! I really don't think I'm 'perfek' either, just trying to upgrade programmers in general. Might as well be professional about it while we're at it.

SOME FURTHER THOUGHTS ON FORTH

Some of you are probably not interested in FORTH, and are groaning at the thought of more on the subject. I promise to be brief and then drop it. A recent issue of Dr. Dobbs Journal contains an excellent analysis of FORTH by H.T. Gordon who wrote the articles comparing instruction sets of the major Microprocessors in Kilobaud Microcomputing last year. He admits that FORTH is new to him, but has some interesting observations. Since it took me a couple of weeks of thinking about what he said before it really sunk in, I will pass my observations along to you, probably considerably modified by what I read in Mr. Gordon's article. I think the best analogy would be to say that FORTH is to BASIC as the Z-80 instruction set is to the 6809 instruction set. Another way to put it is to say that FORTH is to BASIC (Pascal, Fortran, Cobol, whatever you like) as English is to Spanish (or many other languages). That is, English is a collection of scraps of many other languages, and is very IRREGULAR. Spanish on the other hand has much simpler rules (each of the vowels, for example, has only ONE pronunciation). Similarly, the 6809 instruction set is REGULAR. Z-80 proponents pooch the 6809 because it doesn't have as many instructions. While we 6800-09 users have a single BIT test, for example, (BIT A #00010000), the Z-80 user has the advantage of a separate distinct instruction for testing EACH bit. Is that an advantage?

To pursue the point with FORTH, a few examples come to mind. (Both precipitated by Mr Gordon's thoughts.) Take, for example, just two instructions in FORTH: SWAP and ROT. SWAP swaps the two top 16 bit values on the stack. That is equivalent to "pulling out" the second item and placing it on top. ROT "pulls out" the third item and puts it on top. Why not therefore have a whole class of REGULAR instructions to "pull out" the Nth value and put it on top of the stack (2TOP, 3TOP, 4TOP) etc. Wouldn't that be easier to learn? There is another group of instructions that "copy" an item on the stack to the top of the stack without removing it from where it was. These are DUP, which copies the top item above itself, and OVER which copies the second item onto the top, (over the first item). Again, there is regularity here. Why not a regular set of instructions such as 1COPY 2COPY etc. Better yet, the size of the irregular instruction set could clearly be reduced by letting the number be an argument put on the stack first (3 TOP, 2 COPY).

Taking this approach just a little further, FORTH has the ability to use double precision arithmetic (32 bits or 4 bytes). It would be ideal to have this feature be a "Modal" command, i.e. the instruction DOUBLE or some such could set FORTH to the double precision mode, just as HEX sets it's I/O conversion routine to accept and output Hexadecimal numbers. It doesn't work that way, however, and instead, the instruction set is more than doubled to accommodate this feature. Multiply is indicated by '*' and double precision multiply by 'D*'. Further, there is allowed Unsigned arithmetic using 'U*' for multiplication. Of course it is up to the programmer/user to have double precision numbers on the stack before using 'D*'. There is a similar set of instructions for divide (/ M/ MOD /MOD), a set for add (+ D+) and a set for outputting the results, '.', for print the single precision number on the stack, 'D.' for double precision, 'U.' for unsigned single precision, etc. To add to the complication, the FORTH users have defined a standard "pronunciation" of their "words". '.' is not Print, it is "dot". '*' is not Times or Multiply, it is "star". Putting a variable name in a definition gets the ADDRESS of the variable on the stack. Putting a constant name in a definition gets the CONTENTS of the constant (its value) on the stack.

What I am trying to say is that FORTH looks a little like the old (more truth than joke) saying that a Camel is a Horse put together by a committee. It seems that it just sort of grew. There appears to be no master plan in the Standard words. The point of this whole discussion is not to knock the basic idea of FORTH. It is still rather intriguing to be able to write a whole program in a single line. The point is that the basic Standard words of FORTH could be greatly simplified, "regularized" so to speak to make FORTH more manageable. Unfortunately (in my opinion) it is the avowed purpose of the FORTH Interest Group to keep FORTH "Pure" and to keep all implementations of it down the same path. To quote them "No restrictions are placed on cost but we expect faithfulness to the model." This statement follows one indicating that the recipients of their manual will customize FORTH for particular computers, and that they may sell their efforts. FORTH is a language of EXCEPTIONS. To learn it is not to learn the grammar or the syntax, but to memorize each instruction and what it does! This would not have to be the case.

TEXT EDITORS AND PROCESSORS

I was impressed by the review of Stylograph in the October issue of '68'. (Yes, I read it too). We therefore bought it for our company. I have had some chance at hands-on use of it and I am both very well impressed and a bit disappointed at the same time. The nicest thing about it is that it is very simple to learn. I had it down pat in about 4 hours. It is most impressive to see your text appearing on the screen just as it will appear in final form. The formatting is immediate and no separate Text Processor is required. My ADM-3 running at 19.2K baud on the 6809 system is transformed so that it looks very much like a memory mapped video system. (I know, there are some of you out there who think 1200 baud is too fast because you can't read the screen that fast, but the screen oriented editors and formatters have to rewrite the whole screen or major sections of it when you insert or delete a word for example).

We were just a tiny bit disappointed over a couple of things that Stylograph doesn't do as well as the old TSC Editor. It does not have an overlay mode. That may not at first seem important, but with some other screen oriented editors, you may change a 'S' to an 's' by putting the cursor over the 'S' and typing 's'. To do it in Stylograph you must position the cursor over the 'S', type CTRL-s (for single character delete), type '!' to get into the insert mode, type 's' to insert it, and type Escape to leave the insert mode. That is a

penalty of 4 keystrokes to change a single character, while in the overlay mode only 1 is required.

Unlike TSC's Editor, Stylograph won't let you edit a file longer than will fit in its text buffer. That may not be any problem to you at all, if you have a 6809 system with 36K memory and are not trying to write large programs in Assembler. Long texts may conveniently be divided into "chapters", and the 30K+ text buffer will hold quite a few pages of text.

There are a lot of very nice features. You may insert a CR anywhere in the text, splitting a line, or may remove one, concatenating lines. You may type endlessly without regard to line lengths or carriage returns. In addition, you may save and load files to Stylograph at will without exiting the editor. You may use multiple loads, and a file may be loaded at any point within the present text in the buffer. This makes it easy to load, for example a standard Format file (TSC calls it a MACRO file), then enter your text. The format file will contain the margin set-up, page length, and the instructions that set up the header and footer for each page of text. This avoids one problem that always bothered me with TSC's Processor. There could be only one file on the disk, named MACRO.TXT, and you could therefore not have a Letter macro, a Report macro, etc. on the same disk. Stylograph will reformat the text before your eyes when you change a line length command. Incidentally, formatting commands are placed in the text just as for the TSC Processor. There is, however, a command that hides them so that the screen looks exactly like the finished printed copy. Formatting commands are very similar to TSC's, though slightly less in number. The fact that you can see the actual format makes some of them unnecessary. You can insert a footnote because you can see where the page will end, for example.

To summarize, we were impressed with the capability of Stylograph as a word processing tool. It is not as useful in preparation of a program source text because of the missing overlay feature. You cannot, for example go add a label to a source text by putting the cursor in position and typing it in. If you or someone in your family or company does a lot of writing, such as instruction manuals, sales letters, price quotations, sales and work order summaries, etc. you should have Stylograph. The price is good too!

A PUZZLE FOR THE ASSEMBLER GROUP

Recently, I was assembling a large program that I had been modifying, and I suddenly got some obviously wrong results. The listing here is a little test program I wrote that reproduces the screwy results. There is a FATAL error in the program. The 6809 assembler does not even detect the fact that an error has occurred. The 6800 assembler does a little better, and does indicate the detection of an error, but neither print any error messages within the text of the program. This is not a bug in the assemblers, unless you consider their failure to flag the error a bug. I'm wondering how many of you can see just how dumb I am. Remember that the problem was a bit more obscure in the 60 page program that I was working on. The listing here will assemble without changes in either a 6800 or 6809 system. This little error threw me for several hours, and I finally had to sleep on it. The next morning, things clarified themselves, and I was able to cure the problem. Hint— by adding one equate and removing one label, the problem may be cured.

A CHALLENGE

Here's one for you BASIC programmers out there, (or Pascal, Fortran, etc.) If you have an Interpreter or compiler capable of 9 digit or so floating point arithmetic, you can participate in this one. There is no prize but the satisfaction of seeing

your name and program in print. I've recently been working on some approximations for Trigonometric functions. The well known Infinite series calculation for the Sine of an angle works well but requires too many terms to be practical for large angles. A very large angle may be reduced to less than 360 degrees by consecutively subtracting 360 degrees until the result is between 0 and 360. The sine of an angle between 180 and 360 degrees is $-\text{SINE}(\text{angle}-180)$. The sine of an angle between 90 and 180 degrees is $\text{SINE}(180-\text{angle})$. These relationships allow reduction of any angle for the purpose of calculating the sine to the range of 0 to 90 degrees or 0 to $\pi/2$ radians. If we limit the value of the angle to this range, the Infinite series "converges" much more rapidly to an accurate value for the sine. It is possible to neglect the smaller terms of the series and just stop somewhere along the way. The series is:

$$\text{SIN}(X) = X - \frac{X^3}{3!} + \frac{X^5}{5!} - \frac{X^7}{7!} + \frac{X^9}{9!} \dots$$

The '!' stands for "factorial" and means the number times itself - 1 repeated until 1 is reached. i.e., $5! = 5 * 4 * 3 * 2 * 1$. We can therefore do the numerical part of the calculation and arrive at $\text{SIN}(X) = 1 * X - .1666666 * \text{XCTRL}-3 + .00833333 * \text{XCTRL}-5$ etc. You may note that the multipliers (called coefficients) of each term decrease rapidly. If X is small, as it is for angles between 0 and $\pi/2$ (1.5708 approximately), the later terms don't contribute very much. You might imagine, however that if you threw away the later terms, perhaps some "distortion" of the early ones might produce a better approximation, which indeed is the case. I have some results for a very brief approximation, using only the X and X^3 terms:

$$\text{SIN}(X) = .98535 * X - .14160 * X^3$$

This produces a maximum error of around 0.5%. By adding another term, it is possible to get a very large reduction in error. I found the following to produce good results:

$$\text{SIN}(X) = .99965 * X - .16558 * X^3 + .007477 * X^5$$

The maximum error produced by this approximation is approximately .008%, giving an improvement of over 60 times in accuracy. The problem is to write a program to refine these approximations, given something in the ballpark. I have done one for the first approximation above, and it is nearly optimum. The second was found by "systematic trial and error". What is required is to write a program that will use the approximation to calculate the SINE for, for example every 0.1 radian from 0 to 1.6, and compare the results with the actual SINE. TSC Extended BASIC calculates sines to about 14 digits and is useful for testing approximations. The worst case error for this set of coefficients is stored, and one of them modified and the approximation redone. If the worst error is smaller this time, the coefficient just changed is better than the previous value. Based on my experience with the first approximation above, having written a rather inefficient program to do the search, it should be possible to optimize the coefficients in turn, and repeat the process until the best are found. The problem then is to write a program to do just that. An efficient program will at first take large increments in the coefficient, until the error begins to rise, having gotten past the optimum, then back up with smaller increments, etc. I suggest starting with the coefficients for the Infinite series terms, and seeing if you can find the optimum ones for a four term approximation (through the $\text{XCTRL}-7$ term). You will see that the modified coefficients give a very much better approximation than the "correct ones".

If you have the book "Some Common BASIC Programs by Borchers and Poole, you might look at the program on page 151 called "Nth Order Regression" which solves simultaneous equations to compute the best coefficients for this sort of approximation. If you input the values of X and SINE(x) to this program, you may specify the "order" of the solution and it will find such coefficients for you. You will find that truncation of the series causes the even order terms (Xpwr2, Xpwr4, etc.) to produce some improvement, though the coefficients for them are very small compared to the odd order terms. You might try running this program and comparing its results with yours. I will include here a program for evaluating the approximation and the error, given the coefficients, as a starting point for you.

OMEGASOFT PASCAL

My company recently bought the OmegaSoft Pascal compiler. We purchased the whole package including the Source listings of the Runtime Package. We were immediately impressed with the Source code for the Runtime. It is well written and includes excellent comments. We had one operational bug due to having a different version of FLEX9 than the one used to test the compiler, and we notified OmegaSoft's Bob Reimiller. Bob has taken steps to make that function independent of FLEX version and corrected the problem. We later found that the Trig functions gave us erroneous values for some angles and pointed this out to OmegaSoft. We were sent corrections in a few days, with assurances that these have been incorporated in all later copies of Pascal. About ten days later we received two new disks with these corrections and several other improvements in the line of reduction in the Assembly and load time.

Though our confidence was slightly shaken by the initial bugs, the very fast response and their elimination have restored our faith in this compiler. A well written manual is supplied. Pascal is available in FLEX9 and Motorola MOOS (Exorciser) versions, both of which are documented in the manual.

This Pascal takes a slightly different approach to implementation than the previously available versions which have been P-code compilers that require an interpreter at runtime. This compiler generates assembler source code. OmegaSoft has prepared an assembler similar to Motorola's relocatable one for use in assembling this source code. A relocatable object file is produced, which may then be loaded by the use of a linking loader also supplied. If the process sounds like a lot of steps, it is, but OmegaSoft has gone to great lengths to simplify the process. You first prepare your Pascal source text file. This is compiled by Pascal to the assembler source file. OmegaSoft has included a special DEBUG package that includes a very limited assembler and the entire runtime library. This package allows a single pass, single command assembly of the program. At this point, the program may be run, breakpoints may be set, contents of variables examined. At compile time, debug parameters may be included in the assembler source. These appear as comments, and are such things as line numbers for the breakpoint routine. The debugger is not the ultimate in features, but it does allow a quick compile and test of a program. I noted with interest that the program when run in DEBUG runs just as fast as it does in the final form. DEBUG Assembles the program to memory only, and no object file is created when using this mode.

When the Pascal Assembler source (OmegaSoft uses the extension .CO for compiler output) has been

debugged, the next step is to put it in final form. You may go back and recompile it leaving out the DEBUG parameters. You may include your Pascal source code as comments in the Assembler source. At this point, you use a utility (written in Pascal) called BUILDIT. BUILDIT asks you where you want the system and user stacks, and where you would like the finished program to load. It generates the EXEC file that does the remainder of the Assemble and load process. (OmegaSoft keeps with the Motorola MOOS terminology and calls the utility CHAIN that does the same thing as FLEX EXEC utility.) When BUILDIT has finished generating the files, you simply type CHAIN FILENAME. This system is built around using the same filename for all the files associated with the program, and again in the Motorola tradition, different two letter extensions for the various command and intermediate files. As the program is assembled, the runtime library is scanned and only those modules that are actually used or called by the user program are loaded and linked. This approach minimizes the size of the final object code which ends up in a file with the extension .BIN.

Package size for my favorite test program "Prime" is only 2200 bytes, compared to the total of 6500 for Lucidata Pascal. However, this package generated about 700 bytes for my user program. This indicates that Lucidata should generate less code for a very large program, and indeed, I found both to generate very nearly the same number of bytes for a very large program that I now have running in both. The Pascal source text is about 26 pages, and both produce about 20K of object including the respective runtime packages. One could conclude that OmegaSoft favors small programs and Lucidata large programs.

Concerning execution speed, OmegaSoft runs the primes about twice as fast as Lucidata (4 seconds). What about compile time? My 20K program compiled in Lucidata in about 7 minutes. Total compile, assemble, load time in OmegaSoft was 16 minutes. (Compile 4, Assemble 10, Load 2). This is a little misleading, since the final binary file includes all the runtime routines. With the p-code compiler, the runtime package must be loaded in addition to the compiled user program. (I'm just trying not to compare apples and oranges.)

OmegaSoft has built in some interesting features. Variables may be placed at an absolute memory address. This means that you may talk to a parallel port by assigning a variable to the port address, and then assigning a value to that variable or reading its value. Hex values are supported. The floating point package produces 7 digit precision. The Trigonometric functions are all good to at least 6 places. Records and files OTHER THAN file of Character are not supported. There are several string manipulating functions that are extensions of Pascal. These allow the ease of string manipulation that is obtainable with BASIC. Functions supported are STR, VAL (with variations for integer, real, and hex conversions), LENGTH, SUBSTR, and INDEX. The first of these are equivalent to the similarly named functions in TSC BASIC. SUBSTR is equivalent to BASIC MID\$, and INDEX is equivalent to BASIC SUBSTR. It is not hard to write special FUNCTIONS and PROCEDURES in Assembler and link them to the user program. It is also possible to include any often used procedures you may have written, in the runtime library. If for example, you write procedures for Polar to Rectangular coordinate conversion and the inverse, you could put these in the runtime library. Your program would define them and flag them as external. The loader would load them to resolve the external reference generated by your program.

The compiler contains some optimizing features. When compilers translate a line at a time of source code they sometimes produce code that is obviously redundant. The optimizer handles these

situations such as PSHU A followed by PULU A, by deleting both instructions. It looks for other patterns of instructions and replaces them with simpler instructions that do the same thing. Though the number of cases checked for is at this time rather small, it is likely that these are very common in the output of the compiler, and the improvement must be rather significant.

One item that should be mentioned here is the error handling during compile. OmegaSoft issues error messages with the error number and a brief description of the detected error. This compiler does not abort when an error is detected, which is a help in detecting multiple errors in a single pass, but sometimes an error can get the compiler "out of sync" and it will generate a few dozen meaningless error messages, scattered throughout the program. When this happens, the best approach is to fix the first error and try another compile. Since the compile step is fast, this is no great chore. Overall, there is probably more to be gained by allowing the compile to complete itself in spite of errors than to abort it. In general, some of the errors are "bypassed" and don't get things out of sync so that multiple errors may be found and corrected in one pass. When an error message is issued, an up arrow on the line below the error line points to the spot where the compiler "thinks" it has found an error. The program may be compiled without listing, and in that case, only lines with errors and the corresponding error messages are listed to the terminal or printer. The P.CMD works with the compiler, though the use of the CHAIN command file turns the print mode off. It is easy to go in and edit the CHAIN command file to insert the P, required to get, for example, the assembler pass or the load map to output to the printer.

The system has been made very easy to use, and the results are impressive. We have noted a couple of very minor syntax differences between OmegaSoft and Lucidata. OmegaSoft requires single quotes around strings and Lucidata double quotes. The Jensen and Wirth standard calls for the single quotes. There is a slight difference in the handling of input of a character. Lucidata accepts a character as it is struck and returns it immediately. OmegaSoft on READ (ch); puts the character in a buffer and waits for a CR before returning the character to the Pascal program. Two of us read the description in Jensen and Wirth and couldn't decide which is correct, though we think perhaps OmegaSoft is more likely as defined. We needed the other mode, however, since we were inputting cursor control characters and bumping the cursor around the screen in our Pascal program. We wrote a three line function called CREAD (for Character READ) in assembler and linked it to our program. We therefore are able to input in both modes. The program is included here to show the simplicity of adding an external function.

```
NAM SCREEN
OPT REL

XDEF CREAD

GETCHR EQU $CD18

CREAD JSR GETCHR
      PSHU A
      RTS
      END
```

Within the Pascal program, the function is declared:

```
FUNCTION CREAD : CHAR ;
EXTERNAL;
```

The function is used as below assuming that DIRECTION is a variable of the type CHAR that has been declared at the start of the program. Note that no argument is passed to the function, but the type of the value to be returned is specified as CHAR. This sets up Pascal to expect a single byte to be returned from the function. The byte is pushed on the user stack by the Assembler routine.

```
DIRECTION := CREAD;
```

In summary, this is an excellent product with a number of extensions and a few omissions. The extensions make this PASCAL more "real world" and the omissions are not serious. The next release is due later this year. OMEGASOFT has promised a liberal update policy.

BACKUP

By Derek Gitelson

Backing-up is a concept and a procedure. Any well run computer shop backs-up all data and programs on a regular basis. Many of the large computer users even go so far as to have an alternate computer to use if their main one goes down. The idea of maintaining a backup is to prevent total loss of data and programs if something disastrous happens to your system. For example you are running a program that writes to your system disk and it unexplainedly writes all over your DOS file. So as a matter

of course you recover your DOS and whatever other files you considered important from your back-up disk. Or did you neglect to make a back-up?

If you're like me, things like that tend to get overlooked and suddenly you find yourself with only the 6 month old version of that all-important program you need. I tended to overlook the backup process because of the hand-work required to do it. (Read the directories and copy only the new versions of programs to the backup disk.)

To reduce the problem, and hopefully make backing up more regular, and automatic I wrote a program to do 90% of the work for me. The program scans each disk as it is put in drive 1 and if it finds a file on the disk that has a later date of creation than the date on the corresponding file on the backup disk in drive 0 the file is copied to drive 0. If the file does not exist on drive 0's disk, you are asked if you want it backed up and if you answer yes the program does so. The program, as written, does not backup files with .BIN, .BAK, .SYS, or .CMD extensions. This is because all my .BIN files were created from .TXT files, which are backed up; all .BAK files are already older than the .TXT which will be backed up; and all .CMD and .SYS files are from my system disk, of which I have several copies, or are from .TXT files as the .BIN files are.

The program is written in STASMO9 (see ad on page 44 in the December 1980 issue) but may be easily translated to straight 6809 assembly language. After assembling the program, copy it with a .CMD extension to your backup disk. Place the disk in drive 0 and then sequence the disks you wish to back-up through drive 1. As each disk backup is

completed the program will request another or allow you to terminate. If you have your printer file on the backup disk and call BACKUP with the P option it will print each file name as it is copied (if you don't use P the names will go to the terminal).

BACKUP: BACKUP DRIVE 1 TO 0

MICRODYNE

MICRODYNE PRODUCTS

The 68 Micro Journal lab has received three MICRODYNE products for review. They are the BT-1 Active Bus Terminator, the Uniface BR-1 Bit Rate Generator and the MPA and MPA2 CPU Upgrade Clock Xtal kit.

CPU UPGRADE CLOCK KIT

The CPU Upgrade Clock Xtal kit is designed to replace the resistor and capacitor timing circuit of the MPA2 CPU board (SWTPC). By the utilization of Xtal timing (much more precise) as opposed to R/C timing (subject to thermal constant changes and clock timing shifts). For general purpose applications the R/C timing is normally sufficient, but for critical applications, where the clock frequency must run a known rate with stability, the Xtal circuit is the preferred choice.

The kit includes the necessary Xtal (2,000 MHZ) and the necessary capacitors and resistors to effect the modification.

The price is about \$10.00 from MICRODYNE.

THE BR-1 BIT-RATE GENERATOR

For those who have changed over to the S50C motherboard configuration this kit allows the generation of necessary baud rate signals while residing on the 30 pin bus. We have found that this is ideal for those who have upgraded to the 6809 and S50C bus (which eliminated the 50 pin bus baud rate lines). Included are complete instructions for upgrading the older Standard S50 Bus to the new Standard S50C Bus. Also included are instructions for upgrading the MPA and MPA2 CPU boards to more recent standards and Xtal clock operation.

The price is \$65.00 tested and assembled and \$44.00 with partial parts included.

THE BT-1 ACTIVE BUS TERMINATOR

The BT-1 Active Bus Terminator is a Standard S50 Bus board that works wonders on some computers. Some systems seem to generate little noise on the bus, while others running the same boards generate more, to one degree or another. Unexpected 'crashes' and 'hang-ups' are often caused by bus noise. In some systems, a close examination of the address and data lines, while the CPU or other device is accessing them, sometimes shows varied levels of noise and other unwanted non-signals. Active bus termination is the answer. The BT-1 Terminator works fine on one particular system we have here. Microdyne quotes 5 MHZ operation on all standard motherboards. We do not have a 5 MHZ system (we do have a 2.7 MHZ system) and therefore can report that it works fine on that system. Fact is ours (BT-1) now resides on this system. The design is quite similar to the DEC unibus standard. This unit should be a must on those systems running serious applications.

The price tested and assembled is \$75.00 from Microdyne.

All of the above kits can be ordered with gold plated connectors at an additional cost. For more information contact:

GRAPHICS

A Comment

by

Tom Harmon

of

H H H Enterprises

A great deal of my personal software includes some kind of graphic output. There seems to be a magical relationship of person to machine when all your calculations can be reduced to a set of lines or figures on a graphic device. I have played with a number of machines that produce some kind of image, and I found a lot of problems when I tried to bring some of my masterpieces from one machine to another. Generally very ugly variations in Basic, and certainly in the display devices. Strong language became a habit every time I had to go through this process.

Presto! I thought, it would be great if all devices answered the same commands and were independent of the driving language! Bingo! A standard syntax for graphics was born. The exact functions of the syntax were discussed (sometimes loudly) with various peoples, and the result is our standard syntax.

Some basic rules are: 1- a standard of mechanical measurement that is invariant with the display. That way a flower on my screen would not turn into a dot, or a billboard on yours. 2- use of ASCII characters for control to eliminate the variations of languages, since all languages generate ASCII characters to communicate to the outside world. 3- it must be able to support a large number of devices.

Our standard of physical measurement is 0.1 millimeters. A movement of 254 points is exactly equal to one (1) inch (on any device)! It was selected based on the ability of hardcopy devices to resolve this step at a lower limit, while it allows (in 16 bit arithmetic) to achieve a 3 meter by 3 meter plot if your device can stand it. (A survey of graphics for small systems showed that 97.3% of all graphics were done in a space of 8 by 8 inches. This puts a burden on the syntax translator software that has to convert the data

received into what is required to operate a device with less resolution. The first try was with an ISC color terminal and a Hi-Plot (TM) plotter. It was very easy to use since the same programme (in Basic) generated the same data for both devices.

The syntax consists of a single ASCII character as a command, followed by a string of spaces and ASCII digits to transmit values. We have defined the ENTIRE ASCII character set, but will only discuss those characters currently supported (sometimes limited by display device). Commands are generated with a Basic Print statement and sent to the translator as if it were a printer. The delimiter characters are ALL the control characters and spaces, with no limit on the count of delimiters between numbers, this removes the burden of finding out what your language sends for padding etc.

The specific syntax is defined as:

'A X Y Z

AXIS - Draw an axis with tic marks X=1 for horizontal, X=0 for vertical Y= length of segment between tics (.1mm.) Z= number of segments

'B N

BROKEN line - a number from 1 to 127 that controls the size of dashes and spaces in a plotted line (L must =1)

'C N

COLOR - N=0 black (crt), erase(hardcopy), N=1 white (crt), pendown (hardcopy), N=2 is RED, N=3 is GREEN, N=4 is YELLOW, N=5 is MAGENTA, N=6 is CYAN, Multiple uses of digits within a number will allow mixing shades of colors. Number length is limited to 20 digits.

'D X1 Y1 XN YN

DRAW - draw a line from current position to X1,Y1. This will support a list of numbers.

'H

HOME - Does a non-destructive move to 0,0 and does not change any internal flags. (0,0 is ALWAYS the lower left corner).

'I N

INDEX - Puts a mark on the current position. N=1 is a Dot, N=2 is a diamond, N=3 is a square, N=4 is a triangle, N=5 is an hourglass, N=6 is an octagon.

'L N

LINE - N=0 is solid lines, N=1 is broken line (set by B).

'M X1 Y1 XN YN

MOVE RELATIVE - Move the position pointers without marking. Will support a list.

'68' Micro Journal

'P X1 Y1

POSITION - Move to an absolute position, non-destructive.

'R

RESET - Does a home pen on hardcopy, clears the screen of a CRT, sets all flags to startup values.

'S N

SCALE - set size of printable text or marks. N=0 thru 15 for size of marks or letters.

'T N

TILT - the angle to print text or marks. N=0 is normal left to right printing, N=1 rotate 90 degrees, N=2 rotate 180 degrees, N=3 rotate 270 degrees. (there is much argument to change this to N=degrees, but very few devices will allow that.)

'V X1 Y1 XN YN

VECTOR - draw a vector relative to current position. Will support a list.

'W"various text"

WRITE - a 'W' followed by printable text for labeling plots, a C/R terminates the command. IE. PRINT "WTEST STUFF" (in Basic) generates TEST STUFF .

At this time I must say that although we developed this syntax some time ago, I was so impressed by the Watanabe 'Digi-Plot' (TM) plotter that we changed the values used in 'T' and 'I' to match the values that they use. This was done for unified software conversions only. The syntax that they use puts a high burden on the application writer to keep track of the proper delimiters, and forces some really ugly statements in Basic. However, it is such a wonderful device that our finished drivers are very small due to the inbuilt smarts in that plotter.

CRT's bring some special problems. There is some tough math conversions done in the translator software so that an 'average' TV set (3x4 aspect ratio), will display a round circle when called for. At the present, our CRT versions all assume a 13 inch color or 15 inch B&W monitor. This allows the 80 MM circle to be approx. an 80 MM circle on the average device. THE TRANSLATOR SOFTWARE MUST CARRY THE BURDEN OF CONVERTING MEASUREMENTS TO THOSE THAT CAN BE DISPLAYED CORRECTLY REGARDLESS OF THE RESOLUTION OF THE PLOTTING DEVICE.

The very important advantage of this type of approach is that ALL my programmes will run the same way on any other display. To show this let me print a small demo programme (in Basic09(tm)).

```

(* CLEANS THE SCREEN *)
(* YOU CAN JUST AS EASILY OPEN *)
(* A DISK FILE OR PRINTER *)
INPUT "WHAT RADIUS DISPLAY ",RADIUS
(* RADIUS IS IN MM. *)
RADIUS=RADIUS*10
(* MAKE INTO .1 MM STEPS *)
FOR I=0 TO 360 STEP 5
XI=INT(SIN(I)*RADIUS+RADIUS)
YI=INT(COS(I)*RADIUS+RADIUS)
PRINT#PLOT,"P",RADIUS,RADIUS,"D",XI,YI
(* NOTE THAT I DONT CARE IF THERE IS*)
(* ONE SPACE OR 10 BETWEEN NUMBERS *)
NEXT I
PRINT#PLOT,"H"
(* BRING BACK TO HOME POSITION *)
CLOSE#PLOTEND

```

The whole thing is done by 'P' for position and 'D' for draw. This generates the same (size too) image on both my Hazelwood VC-256 and on my Watanabe MILOT. No rewriting! Using this syntax means that other people can run applications on their systems and send me the data, (by phone or diskette) and have it plotted on my hardcopy machine. It also means that development can be done on a video display MUCH faster than on the hard copy.

GAMES interface will use the lower case ASCII character set for special shape tables and manipulation of data. (We are currently discussing the addition of 3D conversions). We would like to hear suggestions as to what the most used functions would be.

Use of a standard syntax for graphics will bring many people into the SS-50 world since interchange will not depend on the device in use. The more people that write for SS-50, the more choices we have.

MORE SPEED?

I too have run the Basic programme that generates primes as a test case. (see fig. 1). TSC times are from his article in April 81 Micro Journal. Here is the result:

TSC UniFLEX BASIC	1h 10min 10s.
TSC UniFLEX PASCAL	34min 35s.
OS9 BASIC09	23min 45s.

Does that mean that BASIC09 is faster in everything that it does? To test that I loaded Dave's PASCAL algorithm (Niklaus Wirth) into my BASIC09 and ran it. (see fig. 2). OH ME, it was slower!

TSC UniFLEX PASCAL	5.6s.
OS9 BASIC09	47 s.

Is BASIC09 slower than TSC PASCAL? NOT in the first test!!! All this shows is that test programmes can be written to take advantage of certain known speed advantages. In any test, a native code compiler output will probably be faster than an interactive language. But it was not faster on the original test. No mention of CPU speed was made for either test, no mention of process stack loading and background servicing. I had nine (9) background tasks running before I could make the original test stretch out to 1 hour.

Another thing to consider is the compile procedure and time taken. BASIC09 is BOTH a compiler and interactive for live tracing. The actual compile time is less than 0.3 sec. for this size programme (actually I have not figured out how to measure this yet as it is too fast to see any delay on the terminal even at 9600 baud, so I feel safe in saying <0.3 sec.). Those of us that have used Software Dynamics Basic Compiler (6800) know what a pain it is to go back to source and correct a mistake and then go thru the compilation procedure again, only to have to do it again on the next error found.

Let us propose a test of true system throughput, using common equipment. Let us find a programme that will exercise a system using average business or scientific programmes since it has been a long time since I needed the first 1229 prime numbers. It should probably be in Basic, but I will not turn down PASCAL out of hand since BASIC09 will run it with minor modifications. (I think that using '=' is a waste of typing time). I also have never seen any business programming in PASCAL! The test should include I/O to a printer (300 baud), to test I/O handling (ie. does the system turn the cpu back to do crunching instead of waiting for I/O?). It should use floppy disk (very few people have hard disk), and a terminal (not mapped video). I could be unfair and ask that the entire thing run in 50K of ram but even though most of us have less than 56K I will allow 96K of ram for UniFLEX. (IS THAT REALLY THE MINIMUM??).

In terms of size, BASIC09 and OS9 should run against normal FLEX and its' Basic, but that would be a severe case of mismatch as FLEX has none of the multitasking and multiuser goodies or resource management of OS9 or UniFLEX.

An interesting example of ambiguous test results is the Martin test of the same issue (see fig.3). Why is BASIC09 only slightly faster than plain TSC Basic? BASIC09 is 9 digit display, 10 digit internal accuracy. The Martin test looks more realistic for comparison, and I have not modified it to take advantage of those statements that might make it much faster in BASIC09.

TSC BASIC 147 SEC.
TSC EXT BASIC 272 SEC.
OS9 BASIC09 139 SEC.

Now that I have spoken out for fair tests I must tell you what I used for a system for my tests. SIMIX CPU card at 2mhz., SMOKE SIGNAL BROADCASTING DCB-4 disk controller, 56k ram, a ET-64 terminal, an ISC terminal, a TeleVideo terminal, 8 inch DS/DD and 2ea. 5inch SS/DD drives. (also a CDS-1, not installed yet.). THE SOFTWARE THAT I RAN CAN BE INSTALLED ON MOST EXISTING 6800 SYSTEMS WITHOUT USING LARGE RAM AND DOES NOT LOSE ANY CAPABILITIES. You are only limited by the size of programmes as to how many users or tasks you can put on your system. On this system a normal load is two users doing name and address loading (for another customer) and one doing development. (56K!).

I will not engage in a battle of words with anyone, but I will run and print any fair test that includes full specifications, limitations on rewriting, and other controls.

* * FILESORT * *

A Contest Grand Prize Winner

Brian F. Bailey
5701 S.W. 4th St.
Plantation, Florida 33317

"FILESORT" is a comprehensive file cataloging utility program which runs under the FLEX disk operating system by Technical Systems Consultants, Inc. It is written in position-independent code for the Motorola 68000 microprocessor. There are ten commands, most of which may be parameterized with one or more sets of parameter limits. This enables particular files or groups of files to be operated on from a larger group. For example, you may choose to print out all files on disk named "KLANFILE", volume numbers 39 through 52, whose file names begin with "A77A" through "A77Z", which were created between 10/31/79 and 4/4/80. The fast Shell-MITCHELL sort subroutine may be keyed on any or all of the file and disk parameters, in any order.

In this version, the following commands are implemented:
["less" indicates optional entries]

R: Read catalog file from disk: the default drive is the working drive, and the default extension is ".CAT"; the file is read and all entries which match the parameter limits are added to the buffer.

Syntax: R,<file spec> [,<optional parameter limit(s)>]

W: Write catalog file to disk: the default drive is the working drive, and the default extension is ".CAT"; all entries which match the parameter limits are written to the disk.

Syntax: W,<file spec> [,<optional parameter limit(s)>]

C: Catalog disk: the disk catalog is read and all of the disk and file attributes which match the parameter limits are added to the catalog buffer.

Syntax: C,<drive number> [,<optional parameter limit(s)>]

D: Delete catalog entries: all entries which match the parameter limits are deleted; an "Are you sure" prompt is issued in order to prevent accidental erasure through mistype commands.

Syntax: D [,<optional parameter limit(s)>]

P: Output catalog buffer to printer: all entries which match the parameter limits are printed.

Syntax: P [,<optional parameter limit(s)>]

NOTE: The "P" command assumes that the system print routine is resident. If not, you may call it with the "I" command (i.e. enter "I.P" before using the FILESORT "P" command).

T: Output catalog buffer to terminal: all entries which match the parameter limits appear on the terminal.

Syntax: T [,<optional parameter limit(s)>]

X: Execute FLEX command line: the command line following "X" is passed to FLEX for processing.

Syntax: X, <FLEX command line>

NOTE: All FLEX commands run using "X" MUST NOT modify FILESORT or its buffer space.

N: New catalog: the buffer will be cleared and FILESORT will be restarted. An "Are you sure" prompt is issued.

Syntax: N

Z: End FILESORT: return to FLEX. An "Are you sure" prompt is issued.

Syntax: Z

S: Sort catalog buffer command. The sort command uses a fast multiple key version of the Shell-MITCHELL algorithm. The user may enter any or all of the parameter keys in any order, and the catalog buffer will be sorted according to these keys. If no keys are entered, the default order will be used (FN, FS, FI, IN, DS, DV, DE). For example, if "S.FI,FS,DS,DV,FS" is entered, the sort will be keyed first by file extension, then by file date, then by disk extension, then by disk volume number, and finally by file size. All unspecified parameters will be keyed in default order, unless "X" is entered at the end of the parameter list, in which case the unspecified parameters will not be considered.

The parameters are:

FN = File Name
FE = File Extension
FS = File Size
FI = File Date
IN = Disk Name
DS = Disk Extension
DV = Disk Volume Number
DE = Disk Date

PARAMETER LIMIT NOTATION:

The R,W,C,D,P, and T commands may all be parameterized. In each case, you may specify lower and upper limits for each parameter, and only entries within those limits will be affected by the command. Parameters are entered as follows:

<parameter abbreviation>=<parameter specification>=<delimiter>

The parameter specification is in one of three formats, depending upon the type of data:

- 1) FN,FI,DS, or DE : {alphanumeric name with optional wild card character(s)}
- 2) FS or DV : Decimal Number
- 3) DD or DE : Month/Day/Year

The "wild card" character is a "?", and will match any character in the same position within the name or extension. For each parameter specification, you may enter either a single value, or a pair of values separated by a colon.

Examples:

```

FH=FILESORT
FS=12
FS=1:24
FE=BIX:CMD
DS=10/21/79
FD=10/1/79:1/24/80
FM=A77AA:TA770NE
DM=7777777777777777

```

Extensions are entered without a period preceding them. If an alphanumeric extension is entered which is longer than necessary (e.g., a four letter extension), then the excess is ignored. If one is entered which is shorter, then the remaining characters will be assumed to be wild card characters.

The delimiter may be a comma, a semicolon, or a carriage return. Commas are used in order to separate multiple parameter limits within one group; for example:

```
F,FM-CAT,FE-BIX:CMD,FD=10/1/79:10/21/79
```

would delete only entries whose file name began with "CAT", which had an extension between "BIX" and "CMD" inclusive, and which were created during October, 1979.

Semicolons are used in order to separate different sets of parameter limits. The command's action is repeated for each of the sets of parameter limits; for example:

```
*,TEST,FE-CMD,FS=1:10: FS=100:340,IV=1
```

would create a file on the working drive named "FS1.CAT", and would write to it all entries whose file extension was "CMD" and whose file size was one through ten. It would then start at the beginning of the catalog buffer again and write all entries whose file size was 100 through 340 which were located on any disk whose volume number was one.

A carriage return signifies end-of-line. If no parameters are entered for a command, all files will be considered as matched.

RUNNING FILESORT:

FILESORT is written in position-independent 6800 code. It may be run anywhere in user memory without any changes; however, the initialization routine compares FILESORT's midpoint with the midpoint of user memory as obtained from FILL (by dividing the user memory limit value by two). If FILESORT is past the midpoint, the area below FILESORT will be used for the catalog buffer; otherwise the area above it will be used. If FILESORT is above the user memory limit, then the entire user memory space will be used. For this reason, FILESORT should be near either end of memory for maximum catalog capacity. If you have other programs in memory and wish to specify fixed areas for the buffer, simply put the starting buffer address in `BUF16` and `BUF17`, and put the ending buffer address in `BUFEND`. The addresses for these variables are:

```

BUF16 = $0013 - FILESORT lower boundary
BUF17 = $0015 - FILESORT lower boundary
BUFEND = $0017 - FILESORT lower boundary

```

You must then start FILESORT at the very start address, which is the cold start address (FILESORT lower boundary) plus three. In this case, do not use the `M` command, since it re-initializes the buffer. If you wish to clear the buffer, type `"B C/B"`.

This program is a much-enhanced version of my original 6800 file sorting utility. If you have any questions, I will be working in New York City from April 20 through early October, but if you contact my Florida address, the message will be related to me.

Brian F. Bailey, WM4MFP (V 8 Motorola Micro Processors)
2901 S.W. 4th St.
Plantation, Florida 33317

P.S. I hope by next January to have my 6800E system running.

'68' Micro Journal

• APPLICATIONS

'48' Micro Journal
3018 Hamill Rd.
P.O. Box 849
Hixson, Tennessee 37342

Dear Mr. Williams:

This is addressed to all SMTP CT-64 owners, who have had to sit back and watch as all those other people did all those great things on their memory-mapped displays.

Now you can join the fun. All you need is a spare 8 bit output port and this circuit, to give you CT-64 a fully addressable X,Y cursor. The fact that has been kept secret all these years is that the cursor position counters are presettable, which means that you can preset the horizontal counters (IC35 & 28), with a 6 bit word (0-63), and the vertical line counter (IC34), with a 4 bit word (0-15). Then when the load

076: 14E)

00000	01000	02000	03000	04000	05000	06000	07000	08000	09000	10000	11000	12000	13000	14000	15000	16000	17000	18000	19000	20000	21000	22000	23000	24000	25000	26000	27000	28000	29000	30000	31000	32000	33000	34000	35000	36000	37000	38000	39000	40000	41000	42000	43000	44000	45000	46000	47000	48000	49000	50000	51000	52000	53000	54000	55000	56000	57000	58000	59000	60000	61000	62000	63000	64000	65000	66000	67000	68000	69000	70000	71000	72000	73000	74000	75000	76000	77000	78000	79000	80000	81000	82000	83000	84000	85000	86000	87000	88000	89000	90000	91000	92000	93000	94000	95000	96000	97000	98000	99000	100000	101000	102000	103000	104000	105000	106000	107000	108000	109000	110000	111000	112000	113000	114000	115000	116000	117000	118000	119000	120000	121000	122000	123000	124000	125000	126000	127000	128000	129000	130000	131000	132000	133000	134000	135000	136000	137000	138000	139000	140000	141000	142000	143000	144000	145000	146000	147000	148000	149000	150000	151000	152000	153000	154000	155000	156000	157000	158000	159000	160000	161000	162000	163000	164000	165000	166000	167000	168000	169000	170000	171000	172000	173000	174000	175000	176000	177000	178000	179000	180000	181000	182000	183000	184000	185000	186000	187000	188000	189000	190000	191000	192000	193000	194000	195000	196000	197000	198000	199000	200000	201000	202000	203000	204000	205000	206000	207000	208000	209000	210000	211000	212000	213000	214000	215000	216000	217000	218000	219000	220000	221000	222000	223000	224000	225000	226000	227000	228000	229000	230000	231000	232000	233000	234000	235000	236000	237000	238000	239000	240000	241000	242000	243000	244000	245000	246000	247000	248000	249000	250000	251000	252000	253000	254000	255000	256000	257000	258000	259000	260000	261000	262000	263000	264000	265000	266000	267000	268000	269000	270000	271000	272000	273000	274000	275000	276000	277000	278000	279000	280000	281000	282000	283000	284000	285000	286000	287000	288000	289000	290000	291000	292000	293000	294000	295000	296000	297000	298000	299000	300000	301000	302000	303000	304000	305000	306000	307000	308000	309000	310000	311000	312000	313000	314000	315000	316000	317000	318000	319000	320000	321000	322000	323000	324000	325000	326000	327000	328000	329000	330000	331000	332000	333000	334000	335000	336000	337000	338000	339000	340000	341000	342000	343000	344000	345000	346000	347000	348000	349000	350000	351000	352000	353000	354000	355000	356000	357000	358000	359000	360000	361000	362000	363000	364000	365000	366000	367000	368000	369000	370000	371000	372000	373000	374000	375000	376000	377000	378000	379000	38

BIT BUCKET

line# of the counters are pulsed, the cursor will be at that x,y location on the screen.

Sounds easy doesn't it? You just use two 8 bit ports to output the 10 bit word and your in business. But what if like me you only have one 8 bit port available. Well that is where this circuit comes in.

The schematic gives all the information needed in order to build and connect the circuit to the terminal, so I'll just give a brief description of how it works.

In order to position the cursor you first output the horizontal position (0-63), and when the data read line is pulsed low, this 6 bit word will be latched into the register of IC1, 2 & 3. You then output the vertical position (0-15), but first add 40 to the value. This is because we counted a value of 40 to tell that this is vertical information, and since we only use 4 bits for vertical data, we can use the other 4 bits as a flag. Now when you output the vertical position (240-255), this will be detected by the 4 input gate of IC3b, and this condition when combined with the data read pulse, will enable the load line of IC3c, 28 & 34. When this happens, the 6 bit binary held in the register of IC1, 2 & 3 will be loaded into the 4 bit vertical data are loaded into IC3d. This will immediately place the cursor at that x,y location on the screen.

As you can see, the operation of the circuit is very simple. The only things to remember are that the last horizontal data word received is always held in the registers and that the cursor is positioned only when vertical data is received.

Now as to the software to drive the circuit. Enclosed is a couple of routines that I have used. The first routine is used to initialize the output port, while the second routine is used to output a word to the port and also generate the proper data ready pulse on the CA2 line. The second routine is written to be used by the USR(x) function in BASIC. In this case (X) will be the word number. The first routine is a macro. The subprogram when called will output the least significant byte of the 2 bytes stored by the USR(X) function.

I had better end this now, as I have already taken up enough space in this great magazine. Let me just add that although I don't have a schematic for it, I would imagine that this same idea could be applied to the CF-102.

Sincerely,

Larry E. Olson

SANSASKA SYSTEMS
3311 Concord Blvd
Concord CA, 94519
March 12, 1981

PRODUCT ANNOUNCEMENT

Sansaska Systems announces the release of two handy reference cards for Motorola CPU based systems. One card is for 6800 FLEX 2.01bit and the other is for 6809 FLEX 9 (tm). Each is printed on card stock suitable for heavy use. Each card contains the addresses of the public entries into FLEX as well as the definitions for an FCB, PMS function codes and error codes. In addition entries for the more common monitors are provided.

The cards are available for \$1.95 + \$.25 postage & handling (CA add \$.13 tax) from Sansaska Systems, 3311 Concord Blvd., Concord CA, 94519. Please specify which one you want. Dealer inquiries invited.

FLEX is a trademark of Technical Systems Consultants, Inc.

NEW PRODUCT ANNOUNCEMENT

UNICOMP BT-1 ACTIVE BUS TERMINATOR

- Occupies one S-50 slot
- Allows at least 5 megahertz operation on all standard motherboards
- Presents 120 ohm active termination compatible with bus driver and receiver chips used with Digital Equipment Corporation's Unibus standard
- Maintains compatibility with other chips used on standard S-50 boards

Assembled and tested \$75.00

Don Williams
'68' Micro Journal
3818 Kemill Road
P. O. Box 849
Hixson, Tennessee 37343

Dear Don,
GIMIX is now including three new utilities with their GIMIX PLEX for the GIMIX Double Density Disk Controller. These three utilities are:

USEMPT	Enables users who don't have GIMIX CPU Cards to use the print spooling feature of GIMIX PLEX. It substitutes the SWTPC MP-7 for the 6848 as the interrupting device.
USED4	Enables the user to read and write double density 5" disks formatted on the SWTPC DC-4 controller.
UNUSE	Enables the user to configure a drive back to normal after using the USED4 command.

These utilities, as well as a utility to read and write to SWTPC extended format double density DMF-2 formatted disks, will also be available for the GIMIX DMA Disk Controller.

Any user that would like their disk updated should send their ORIGINAL GIMIX PLEX disk to GIMIX and we will update it without charge.

This eliminates the "incompatibility" problems for users of GIMIX hardware.

Sincerely,
Bob Phillips
Bob Phillips

2457 WEHLE DRIVE • BUFFALO, NEW YORK 14221 • 716 631 3011

March 27, 1981

NEW DBM 11

We are now releasing the greatly enhanced DBM 11: a concise Data Manager and Basic Programming standard. By combining many features into a tighter structured code, we now have more disk space, (run's on a double sided 5" disk), Precompiler compatibility and many new features to mention but a few:

Report Generator	- Totalize Fields - Modify Titles - Decimal Alignment - Sorted & Keyed Order Output - Text Processor Compatible Output - Sequential & Spooler Output
Label Printer	- Multiple Fields On Each Line - Sorted & Keyed Order Output - Label Alignment
File Routines	- 1-45 Fields - 0-4 Place Decimal Accuracy - Floating Point Rounding Algorithms - Previous Field Insert/replace - ISAM Structured Key Files on any Alpha Field - Greater Protection against Accidental Delete - Edit Routines-Multi-Feature/Access

The new release is now available to all registered users for \$35.00. Please send in your original disk.

8800/8809 COMPUTERS

188-8th Street, Avenel, N.J. 08202
(609) 967-4280

MARCH 26, 1981

48K RAM/ROM CARD
***** 2MHz STATIC *****
INTRODUCTORY PRICE
S-R/R ASSEM. +TESTED \$440.00

THOMAS INSTRUMENTATION is pleased to announce the availability of a new static memory card. The card uses the new low-power, off-the-shelf 2816P-2 (2128) RAMs and/or 2716 ROMs. The user may mix any 4K block combination of RAM and ROM. The S-R/R contains 24 2K blocks that may be memory mapped in any 2K boundary in a full 64K system. It is 68000 and 6809 compatible, decoded for extended addressing and runs on 5 volts only. The S-R/R has several exciting features. The card's extremely low power consumption (1/2 amp with 48K RAM) is of special importance. The lack of heat build-up in the chassis will impress most users. The total reliability and compatibility of static as opposed to dynamic is still a major factor to many users when buying more memory. The card can be used on the 55-50 or 55-90C buss.

The best, however, has been saved for last. The S-R/R is fully tested at 2 MHz with standard 250ns chips. 150ns and 100ns chips are available---making the S-R/R the fastest memory card on the market.

Regarding your February issue, '6809 PERFORMANCE TRENDS', Al Noreira covered the TBC basic to (among others) Lucidate's Pascal, claiming the Pascal as the winner. The Pascal was run using integer arithmetic while the basic program was using floating point arithmetic. I'm sure that this is not a proper comparison.

FOR IMMEDIATE RELEASE

December 1, 1980

Contact: Stuart (213) 644-0113

**ELECTRONIC TOOL COMPANY NAMED MASTER DISTRIBUTOR
FOR WAVE-MATE CORP. COMPUTER PRODUCTS IN U.S. AND CANADA**

Wave Mate, Inc., and Electronic Tool Company today jointly announced a long-term marketing and distribution agreement for Wave Mate computer products and systems.

Under the agreement, Electronic Tool Company will be the sole Master Distributor for Wave Mate computer products in the North American Continent. ETC will provide marketing support, set up regional distributors and retail outlets and also service the OEM market for Wave Mate products.

Products covered under the agreement include the Wave Mate "Jupiter" Series Computers, the newly-developed Wave Mate "2000" series computers, and certain custom systems based on these machines.

In production since September, 1980, the Wave Mate 2000 is a fully self-contained system for small-business, intelligent-terminal, word-processing, and OEM applications. Featuring extensive software support, languages such as BASIC, FORTRAN, and PASCAL, and numerous application packages,

a typical Wave Mate 2000 system contains a 68000 2MHz CPU, 64K

memory, two 184 kilobyte mini-floppy drives, I/O bus, keyboard and 80x25 display in a single 45-pound package costing less than \$3200 in single-unit quantities. Internal space for up to 3 interface modules, plus 2 programmable serial I/O EIA interfaces, make the system ideal for intelligent terminal and OEM applications. In OEM quantities a 4K system with 734 KB disk can be had for less than \$2400.

Wave Mate, Inc., founded in 1975 and based in Cereon, CA also has distribution in Europe and South America. Electronic Tool Co., founded in 1978, with offices in Hawthorne and Los Altos, CA, is both a manufacturer and distributor of computer products and systems.

Comments on 6809 subroutine linkage

J. L. Wood performed a useful service when he (?) produced the article "6809 subroutine interface" in the February issue. The subject is sorely in need of discussion, but is distinctly missing from the literature.

The author is incorrect when claiming that the "call-by-reference" argument transfer method cannot support recursive and reentrant procedures. Such a statement would imply that those have been doing exactly what the author claims is impossible. It would seem that the author has confused the method of generating a data item with the method used to reference it. In the article's Tower of Babel example, passing a pointer to the variable "n_min_1" makes each reference as unique as passing the value of that variable.

In the real world, using the "call-by-value" argument transfer method is quite awkward, if strictly applied. If an array or other such extensive data is passed by value, all the data must be copied with the accompanying time and memory space penalty. The author even contradicts his own position when in section 4.5.4 he states that arrays to arrays should be by reference (pointer). Strict call-by-value makes it difficult, if not impossible, for the called procedure to assign values to the actual parameters.

Some of the higher level languages such as PL/I straddle the fence on the argument transfer method issue by using "call-by-dummy-argument". In this method, pointers to the arguments are passed, but the pointers may reference temporary (dummy) data areas into which the value of actual arguments, such as an evaluated expression, are placed.

The article's method of managing the S stack is adequate, but it fails to address some of the issues of importance to higher level programming languages. Some of the higher level languages such as PL/I and Algol which allow nested procedure definitions require a more complex process to link invocations (execution) with the data they can reference. It is typically necessary to maintain both static and dynamic links so that the currently executing procedure has access to the proper data. The static link provides for the situations related to the lexical (as-written) order of the program while the dynamic linkage provides for the situations related to the execution order of the program. Neither the static nor the dynamic linkage is sufficient by itself to handle all situations, so both are required in the general case.

I have evolved a method for managing the local environment of a procedure which is slightly different from the one given in the article. I use the Y register as the "stack marker", thereby retaining the somewhat more powerful U register for use within the procedure.

```
ACSAVE SET *
LOCVAR1 RMB 1
LOCVAR2 RMB 2
REGS SET *
RMB 8
ARGPTR1 RMB 2
ARGPTR2 RMB 2
ORG ACSAVE

entry PUSH U,X,Y
LEAS -REGS,S
LEAV 0,S
Set the "stack marker"
...
LDD 1(ACPTR1,Y) D = argument value
...
LDX ARGPTR2,Y X = argument address
...
LEAS REGS,Y
PULS Y,U,X,PC
Clear the stack
Restore the registers and exit
```

If the assembler supports multiple definitions of labels on SET statements, the several independent subroutines can be processed as one "job". The same procedure entry and exit code can be used for all the subroutines in this case. Otherwise, the SET statements can be converted to EQU and unique names used for each procedure or each procedure can be separately processed.

The Method illustrated above has the side benefit of clearing the S stack of any undeclared data items which may have been pushed onto the stack. These items are automatically cleared upon exiting the procedure without having to know how many are present.

It could be argued that the second and third instructions of the illustration should be reversed and the exit code modified accordingly. The local data would then have negative offsets relative to Y while the parameters would have positive offsets, thus more fully utilizing the 6809 four-bit offset's addressing range. However, the illustrated method is easy to main-

tain and the typical procedure doesn't have much local data. Even if the argument pointers are outside the four-bit offset range, those pointers are not often referenced within the typical procedure.

Page three

One should be careful about never using absolute addresses for references. If one wishes to have a relocatable which references typical microcomputer OS routines, these references must be absolute. A relative reference will vary with the location of the referencing program, whereas absolute references will not.

Sincerely yours,

Dear Don,

Recently Manfred Peschke submitted to you a letter extending the 6809 Performance Timings of Moreira ('68' Micro Journal 2/81). He compared the prime number search program in two versions of BASIC with the equivalent computation in FORTH using my tFORTH from Kenyon. Manfred told me of his first result (called I in table II) and I suggested how to redo MOD to speed it up (it reduced the time by about 60%, called II in table II), but I was still convinced that FORTH should perform much better. A look back at Moreira's assembly language algorithm showed what was happening. The tFORTH MOD word is implemented in high level FORTH, permitting signed argumental it does a full 32-bit/16-bit division, keeping the remainder only.

Most simply stated, the prime number test is not a very good test for the purpose of comparing languages. The reason is that the time spent in the test is almost entirely dependent upon the way the MOD function is implemented and little dependent upon the particulars of the languages themselves. The set of benchmarks in Kilobaud Oct 1977 provides a much fairer comparison because they provide a means of separately testing various aspects of a language.

To prove this point and to illustrate the true speed of FORTH, I created another version of the MOD function in tFORTH to perform only the exactly analogous function as in Moreira's assembly listing (shown below as tFORTH MOD III).

This timing shows that tFORTH is approximately a factor of 2 slower than pure assembly code, provided one compares equivalent algorithms. This also shows another feature of the language FORTH: it is easy to isolate the most time consuming aspects of the high level code and redo it in assembly language to improve the speed. Certainly one could do the equivalent in BASIC by using functions, or by the RUN feature of BASIC90. However, it is easier and more natural to do it in FORTH because the nature of the language is such that the user is closer to machine language to begin with.

For comparison, the MOD III version in 6800 tFORTH takes 1.8 times longer than the 6809 version (same clock speed).

Sincerely yours,

Ray Talbot
Ray Talbot

Table II: Execution Speed Comparisons of Prime Number Calculations, Comparing Various Ways of Performing the Computation Using tFORTH -- all comparisons with 1MHz 6809

Source	Language	Feature	Minutes
Peschke	tFORTH	standard MOD I, permits signed arguments	26.2
Peschke/Talbot	tFORTH	MOD II, restricted to positive numbers	31.2
Talbot	tFORTH	MOD III - exact algorithm used by Moreira, restricted to positive numbers	12.0
Moreira	Assembler	MOD III, restricted to positive numbers	6.2

LISTING:

MOD I -- the standard word MOD in the FORTH INTERPRET GROUP FORTH and as implemented in tFORTH:
 M/ OVER >A >A DABS A ABS U/ A) R FOR
 SETM SWAP R) SETM SWAP I
 /MOD >A >A D) R) M/ I
 /MOD /MOD SWAP I

MOD II -- similar to standard except for: positive arguments only
 /MOD >A 0 R) U/ SWAP I

MOD III -- uses successive subtraction algorithm exactly same as implemented in Moreira assembler listing:
 CODE MOD 2 ,U LDD, BEGIN, ,, ,U SUBD, BGE,
 ,, ,U ADDD, 2 ,U LEAU, ,, ,U STD, NEXT,

In order to provide the greatest flexibility, the original MOD has been kept in tFORTH, but there has now been added a new word called UNMOD which implements the unsigned algorithm III.

Dear Don,

HOORAY FOR YOU!

Very seldom do I acknowledge my support, or lack thereof, of editorials appearing in various publications. Those editorials are what the "Freedom of the Press" amendment to our constitution is all about. It is important that one be allowed to express his opinion, whether I agree with it or not.

However, this time I must write!

It would be difficult for me to be more supportive of an idea than the one you expressed relative to the Iranian situation. It remains a "situation" even today, but the lack of mass publicity about it has let it slip from the mind of the general public. This is most unfortunate as a danger, clear and evident to even a casual researcher, still lingers.

I do take one small exception to your editorial. You terribly understate the case when you say, "Maybe it is of little importance what a small magazine does..."

Don, it is not of little importance what one INDIVIDUAL does. What even a small magazine does is of real importance to America and its future.

As ever,

John

Dear Don:

I have noted your criticism of the Radio Shack TRS-80C color computer in recent articles and I appreciate your interest in guarding the quality of the products offered to the 68XX community. I also think that praise should be given to a vendor when warranted. In view of this I would like to relate my recent experience with my TRS-80C.

In December of last year I bought a TRS-80C and 15 minutes after getting home with it I had exchanged the memory chips with 16K chips and was up and running. I was very pleased with the computer and as soon as the extended basic became available I sent it back to the store where I bought it for the "basic" upgrade. The computer came back from the service center within 4 or 5 days and the store manager was kind enough not to charge me with an installation fee as shown in the catalogue and there was no complaint about my having added my own memory.

The extended basic is very powerful and the color graphics (the reason I bought the machine) features are outstanding. All went well for a few days until the machine failed to boot up. I wondered what problems I

UNIVERSAL STATIC MEMORY

- ★ 32K bytes - ROM, RAM, EPROM or a combination
- ★ SS-50 A&C compatible with 16 and 20 bit address decoding
- ★ Compatible with all SWTPC 6800 and 6809 computers
- ★ 2.0 MHz - 5.0 Volts only

This is the most versatile memory card you can buy. Our S-32 may be populated with up to 32K of static RAM, EPROM, or ROM, or any 4K block combination of these that you may desire. Any 5-volt 2716 pinout compatible memory may be used in this card. Any 4K block of memory may be jumper block programmed for RAM or ROM use. This feature makes this the ideal memory for those process control applications that require a mixture of ROM and RAM

memory. The board is fully compatible with all SWTPC 6800 and 6809 computers.

The power requirement for the board is only 1.75 amps at 5.0 volts with a full 32K of RAM installed.

S-32 Circuit card only \$ 99.50
 S3216 with 16K of RAM \$295.00 ea.
 S3232 with 32K of RAM \$495.00 ea.

 SAN ANTONIO, TEXAS 78216 (512) 344-0241

WE HAVE A 6809 FOR YOU

POWER SUPPLY

Modular plug-in construction with computer grade filters and a 25 AMP rectifier bridge. Blower fan is standard equipment. All connections to the power line are beneath the safety shield.

INTERFACE

Convenient serial or parallel I/O cards have DB-25 connectors mounted directly on the circuit board. Up to 16 interface devices may be installed on the address decoded I/O bus. Programming strips are provided for input and output baud rate selection on each port. All outputs are fully buffered.

PROCESSOR

The world's most powerful eight-bit processor, the Motorola MC6809, plus 2K byte monitor ROM that is 2716 EPROM compatible and full buffering on all output lines. Built-in multiuser capability, just add I/O cards to operate a multi-terminal system.

MEMORY— You can purchase the computer with either 8K bytes of RAM memory (expandable to 56K), or with the "S" series 64K bytes of RAM memory expandable to 768 K.

PERIPHERALS— The wide range of peripheral hardware that is supported by the 6809 includes: dot matrix printers (both 80 and 132 column), IBM Electronic 50 typewriter, daisy wheel printers, 5-inch floppy disk system, 8-inch floppy disk systems and a 16 megabyte hard disk.

SOFTWARE— The amount of software support available for the 6809 is incredible when you consider that it was first introduced in June, 1979. In addition to the FLEX9 operating system, we have a Text Editor, Mnemonic Assembler, Debug, Sort-Merge, BASIC, Extended BASIC, MultiUser BASIC, FORTRAN, PASCAL and PILOT.

69/K Computer Kit with 8K bytes of memory	\$ 575.00
69/A Assembled Computer with 8K bytes of memory	\$ 695.00
09/ Assembled Computer "S" series with 64K bytes of memory	\$1,595.00

might have since I had technically voided my warranty by adding the memory expansion. I took the unit to the Radio Shack store in Rossville, Ga., where I had purchased it and told the manager to send it for repair and to advise me if there would be a repair charge due to my voided warranty. After a few days I heard from the store manager and he said that the problem didn't appear to be related to my added memory and it would be back in a few days. I recieved the computer promptly and it worked perfectly. There was no charge to me for the replaced logic gate and two hours labor.

I don't know whether your editorials and communication with Tandy have influenced their policy or not but I thought it would be worth letting you know my satisfaction with my TRS-80C and particularly with the service obtained from my local store.

Keep up the fine job on the magazine.

Yours truly,
David Hanon

Dear Bits,
Please consider the following for publication...

SWTP CO-RESIDENT EDITOR ASSEMBLER PATCH:

The following code will enable the SWTP Core editor-assembler to output a listing on a printer on another port.
To use this patch first modify core with the following code, then initialise the PIA on port 0 with the SWTBUC commands "0 8". Now after entering your source, but before assembling, use the command "PR". Now all output, except "WHICH PASS" will go to the printer.
On first inspection, one would assume that the output would be echoed on both the terminal and the printer, but this is not the case. All output goes to the printer except "WHICH PASS". As before, CTRL Z will return you to the editor. Also, "PR" before listing will output your source to the printer.
This patch was the result of some late night hacking and may not work on all versions of Core, so a word of caution is in order. Don't modify your only copy, back it up first! Lines 330,340,470, and 480 contain the original Core code. So if your version is the same at these locations, this patch will work.

Robert Lund

Attached are some ramblings on the Radio Shack TRS-80C. They may be useful as "TRS-80c Hints"-which seems to be becoming a regular feature(1).

Bob Margeson
Bob Margeson

TCD630
70310,303

(MORE) TRS-80C HINTS

Once the warranty has expired (or you can not wait any longer) you can remove the seven screws in the bottom and remove the cabinet top. (Three of the screw holes in the bottom are not used. Note which ones they are!) Also - note that the two short screws go on the keyboard edge; the longer screws go in the other five holes.

CAUTION: Once inside the case - use caution to prevent static electricity from damaging components. (Touch chassis ground with hand or tool on entry. Don't shuffle your feet on the rug. Etc.)

Remove and discard any tape which may be securing the large, shiny metal RFI cover. This cover is held in place by metal fingers around it's edge. Remove this cover by gently prying up a little at a time all the way around.

Item #1.

With FLAT black spray paint, put a thin coat on the inside and outside of the metal cover. This is for improved heat dissipation. (Don't paint the inside surface of the metal fingers.)

Item #2.A

Going from 4K to 16K Memory. As mentioned in 68 Micro Journal, January issue, page 17, and in Byte, March issue, page 114, increase RAM memory by removing the eight existing 4027 RAM chips and replacing them with eight 4116 chips. (I use NEC PD416-1 chips with good results.) There are two (plainly marked) jumper clips which get moved from the "4K" position to the "16K" position. A piece of cake!

Item #2.B

Going to 32K Memory. As mentioned in Byte, March issue, page 124, RAM chips may be piggybacked to get 32K of RAM capacity. 1. Use the 'Diagnostic' pack to do the "Long RAM test on 16K of memory. Note: The "Q"uick and "L"ong diagnostic tests are "dumb" and will only test a maximum of 16K. 2. Then repeat the "L"ong RAM test on a second set of eight 4116 type RAM chips. 3. Now piggyback one set of eight chips on top of the other. Push them together only far enough for one chip pin to contact the other. Observe pin #1 orientation on both chips. With a small soldering iron quickly tack solder each of the pins together (EXCEPT for pin #4 of the top chip which gets carefully

bent out to the side.)

4. Install the eight chip pairs back into the sockets. Observe orientation.

5. Use some small solid wire (#30 wire wrap) to connect together all of the #4 pins of the top chips. Use a minute amount of solder or wire wrap.

6. Then use another longer piece of the same type wire to connect this series of #4 pins to pin #35 of the SAM chip (6883). Just push the (uninsulated) end of the wire into the SAM chip socket. No soldering necessary on the main board itself!

That's it - you now have a 32K TRS-80C !!

When you put everything back together, and apply power, if you enter "?MEM" - you will see "31015". And if you enter "CLEAR0", "?MEM" - you will see "31215". It should take awhile to outgrow that!! But like everything else - a word of caution is in order here too. Be aware that address mapping results in the SAM Register (FF60-FFDF) appearing at 8F60-8FDF !

Several additional items which you might consider doing at this time (or the next time you're inside the machine):

Item #3.

Install a voltage transient suppressor across C22 on the power supply board. For insurance ...

Item #4.

Remove two screws holding the power transformer to the bottom cover. Unclip one wire and swing the power supply assembly out of the way. Then with about a 3/8th inch drill, drill from the inside - through the soft bottom plastic to make a series of air holes. (Don't do this on the dining room table!) Avoid the area of the foot (It's on the underside!). Drill holes inside the plastic transformer cavity and around the outside of the cavity well. Avoid having the plastic chips fly off and get lost under the circuit board! Clean up. Put

the power supply assembly back in place. Attach the wire clip. Insert two screws to hold the assembly in place. The purpose of this exercise is to improve the (cooling) air flow around the power transformer

Bottom cover goes on in reverse order. Pop the metal RFI cover back on. Place the top cover back on, turn over the machine and re-install the five long screws and the two short screws. Avoid the three unused holes (The center one will do a bad job on the keyboard ribbon cable - BEWARE!).

On the ROM Packs:
The March issue of 68 Micro Journal, page 14 describes opening the pack. Several of the packs (the "cheap" ones) only use one ROM chip, yet contain space for two. Your own program can occupy this space if you: Disable the FIRQ signal with tape, as described in the above reference, or by drilling the solder out of the hole connecting the two pins. Use a #57 drill. Then use a "solder-sucker" or "wick" to remove the solder from the unused 24 pin space and also the two holes for an additional by-pass capacitor. Install a low-profile 24 pin socket and a 0.01 or 0.1 Mfd capacitor. Your own ROM may now be installed. You may consider using a miniature DPDT toggle switch to alternately connect the Chip Select line of the ROM's (and put the unselected ROM's Chip Select line at +5 volts). Five volt 2716's will work, but a 2732 will get you out of some addressing problems. (This assumes that you are not using 2764's !!)

If you have the "Diagnostics" pack, the basic BASIC ROM CRC is 9505. The extended ROM CRC is 7777.

Misc.
CLOAD or CLOADM - Look in 01E5-6 for the transfer (starting) address. Locations 01E7-8 contain the beginning tape load address.

1.8 MHz Clock - After doing a "POKE 65495,0" my keyboard is "dead". Is yours? Need a 68B21 ??
Good Luck !!

For Sale: SWTPC 4K Memory Boards, \$40.00 each. You pay shipping. Richard Price, 5812 W. Giddings, Chicago Ill., (312)736-8618.

Hello Europe:

For sale: SWTPC 6800 system w/48K memory, 4 serial, 2 parallel interfaces, MP-R EPROM programmer, DSD 32K RAM/EPROM board, AC-30 cassette interface (300 and 600 baud) SWTPC Basic, Dynasoft Pascal, Dis-Assembler, MU-B 4-user board w/4K interger Basic. Also have SWTPC 6809-board. If you need tereinal, can sell MCR 260 thermal printer. Reasonable price. Contact: Rolf Aalberg, Riislukka 58, 1600 Fredrikstad, Norway. Tel. 032-16687.

HELP

Hi,

Help. Need help, just recently got my SWTPC finished and gave it the smoke test. No smoke, but nothing else either. Would like to know if anyone would be willing to help? Would pay postage for correspondence.

Also, I hope you guys at the Journal don't forget the 6800 duffer. Lately there has been alot of 6809 and disk. Lots of prograes for this and that. Well, if I had a system up and running I'd probably be interested. But, I haven't got to that point yet. Also, what happened to the Cassette based coluen?

You guys have a wonderful opportunity with access to subscribers to get a Bug Book or sheet or pamphlet or something together for repair of 6800's or 09's or whatever. You could have fixes for problems, problem identifications, stuff like that. So that when problems arise outside of ones' technical experience a place or source to go to would be available. So panic and desperation don't have to set. There is a need for such a Bug Book. Even though 09 is pushing 6800 into the woodwork, it still is a good system to work around.

There have been a few fixes and MOD's in the Journal, but nothing that would help me or my system in its stillborn condition.

Also, I really appreciated the letter who informed of abandonment of 6800 systems by SWTPC. So please don't forget us aeateurs out here with the ancient 6800.

Would appreciate your thoughts on the Bug Book idea. And eaybe someone could help me bring my system to life. Ray Baumiller 1696 4th Street Ext Monongahela, PA 15063

HELP

Two HELP items; (a) We have a need for a program that will accept Baudot input, automatically search for the speed of transeission, and output ASCII. Will build necessary hardware if any required, but prefer software approach. Has this been covered in '68' Micro Journal? If not, can any reader assist us? (b) Would like to contact the engineer-in-charge at an AM radio station using a directional antenna; have applicable prograes that need

testing; needs systee with two disk drives operating under either einiFlex or Flex 2.0. (Program limits at present are for 2,3, or 4 tower arrays, hope to develop for more towers.) John Tucker P.O. Box 2898 Laredo, Texas 78041

help

Dear Sirs,

How do you do the following with TSC's

Text proccesser:

RESUME 10 Bond Street

Where 10 Bond Street would be read from a disk file!!!?

Thank you,
Jeffrey M. Craig

RMS is a complete DATABASE MANAGEMENT package for the 6809 computer. It is made up of five machine language programs that make up the most powerful business programming tool available for the 6809. It can be used by the relative novice, to implement an incredible variety of information storage and retrieval applications, without any programming. However, the programmer can use RMS as part of the solution to a larger problem, saving many hours of unnecessary program development time. RMS can be used to handle data input, editing, validation, on-line retrieval, sorting and printed reports. Custom data manipulation can be filled in by the user's BASIC programs.

VC-256 GRAPHICS

The VC-256 is a high resolution graphics interface for the SS-50 bus. The controller incorporates a variety of unique and innovative features which provide excellent display quality combined with EXTREME SIMPLICITY of use. It will drive any monitor with composite video input.

Featuring . . .

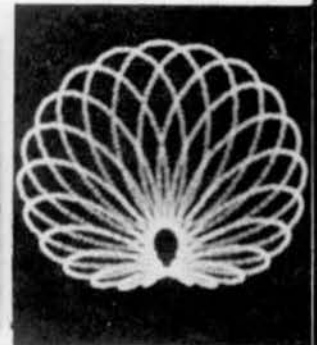

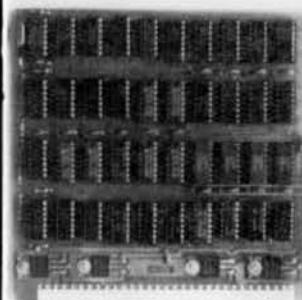

- * individual pixel control
- * true X-Y addressing
- * single instruction erase
- * independent blanking control
- * jitter free display
- * industrial quality construction
- * fully socketed
- * no system memory utilized
- * no address space occupied
- * no splatter on update
- * no adjustments
- * no software driver
- * no software initialization
- * no throughput loss

Specifications

Resolution	256 x 256 (256 x 250 on some monitors)
Bandwidth	8 MHz
Stability	crystal controlled
Addressing mode	X-Y single pixel
Origin	upper left corner
Writing rate	64 microseconds per pixel
Erase time	16.7 milliseconds
Write sync	interlocked
Blanking	program controlled
Output signal	non-interlaced composite video
Memory	65,536 bits in X-Y array on board
Registers	Write: X, Y, Z. Erase Read: status
Port addresses	4 in I/O address space
Physical location	one slot of 30 pin I/O bus
Size	5.6 in x 5.6 in
IC count	40 + 4 regulators
Output	75 ohm coax

SOFTWARE SUPPLIED
(6809 5 1/4" FLEX*) INCLUDES:

- * Camera Digitizer Program
- * Exerciser Program
- * Character Generator Routine
- * Misc. Pattern Programs
- * Line Drawing Routine
(All with Source Code)

PRICE: \$350 — assembled, tested, and burned in
AVAILABILITY: stock to 30 days WARRANTY: 90 days
Supplied with 6 feet of cable less video monitor connector.

AT LAST... A top-notch assembly language programming text based on the Motorola 6809:

MICROCOMPUTER ARCHITECTURE AND PROGRAMMING

by John F. Wakerly
Stanford University

Published in March 1981
by John Wiley and Sons, Inc.

Here is a well-written, authoritative text on the basic principles of microcomputer organization and assembly language programming using the Motorola 6809 as the principal example. MICROCOMPUTER ARCHITECTURE AND PROGRAMMING:

- Develops general principles of microcomputer organization and programming, using the 6809 for assembly language programming examples (Chapters 5-12).
- Concisely describes high level language programming in Pascal (Chapter 2).
- Discusses the important data structures needed in most applications (Chapter 3).
- Relates high-level programming concepts to their counterparts in assembly language (throughout the book).
- Explains modern program design, documentation, coding, and debugging methods (Chapter 12).
- Completely describes, from a programmer's point of view, seven important contemporary microprocessors, with special emphasis on 16-bit machines (Chapters 13-19).

Outstanding physical features of the book include:

- Over 700 pages packed with useful information
- Over 170 illustrations
- Over 200 programming examples
- Over 80 tables
- 22 pages of indexes — ideal for reference use
- Exercises and discussion of references with each chapter

You get all this in a well designed and produced, easy to read and reference 6x9" hardbound book for only \$25.

ABOUT THE AUTHOR

John Wakerly is a computer engineer who has designed microcomputer hardware and software systems in industry, and who has also taught computer engineering to freshmen through graduate students at Stanford University since 1974.

Two years ago Prof. Wakerly set out to write a definitive computer organization and assembly language programming book using microcomputers as examples. He found that the Motorola 6809 had the very best architecture from a pedagogical point of view. Today, he is an avid 6800 and 6809 programmer, and he uses a 6800 based word processing system to write textbooks.

ABOUT MSE BOOKS

MSE Books is a subsidiary of the author's consulting firm, Micro Systems Engineering. Although MICROCOMPUTER ARCHITECTURE AND PROGRAMMING will be available through bookstores, there are several advantages to ordering directly from MSE Books: 10% discount from publisher's list price of \$27.95; prompt delivery; convenient payment methods (charge it!); and automatic notification of any updates. Also, the author will autograph your copy upon request!

TABLE OF CONTENTS

PART 1 / PRELIMINARIES

- 1 Introduction
- 2 The Programming Language Pascal
- 3 Data Structures in Pascal Programs
- 4 Number Systems and Arithmetic

PART 2 / GENERAL CONCEPTS

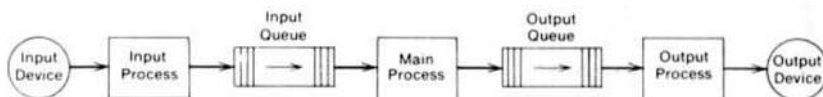

- 5 Basic Computer Organization
- 6 Assembly Language Programming
- 7 Addressing
- 8 Operations
- 9 Subroutines and Parameters
- 10 Input/Output
- 11 Interrupts, DMA, and Processes
- 12 Program Development

PART 3 / SPECIFIC ARCHITECTURES

- 13 DEC PDP-11 and LSI-11
- 14 Motorola 68000
- 15 Zilog Z8000
- 16 Texas Instruments 9900
- 17 Motorola 6809
- 18 Intel 8086
- 19 Intel MCS 48 Family

APPENDICES AND INDEXES

One of many helpful illustrations from the text.

Here's what some knowledgeable reviewers had to say:

"Looks great! It's nice to see someone who understands the 6809 and is so careful to get the details correct."
— Joel Boney, co-architect of the Motorola 6809

"This book shares with the reader the author's insight into the design issues, the whys and hows of modern microprocessor instruction sets."
— Skip Stritter, co-architect of the Motorola 68000

"The book is really enjoyable, and reviewing it has been an extremely interesting and pleasurable experience."
— Harold S. Stone, Professor of Electrical and Computer Engineering, University of Massachusetts, Amherst

"This is an excellent manuscript! It is authoritative, well-organized, well-written, and very much up-to-date."
— David A. Hodges, Professor of Electrical Engineering, University of California, Berkeley

COMPARE THE CMS 6809 ADVANTAGE

Creative Micro Systems is proud of its line of general purpose microprocessor support modules. These M6800/M6809 based modules are pin and outline compatible with the industry standard EXORciser* and Micromodule* bus.

COMPARE THE CHOICE

That's why we want you to compare our products with the competition before you design your next microprocessor based system.

Each module in our product line is designed to respond to the needs of a major computer system function. Our 9609 module, featured above, is a complete microcomputer on a single board. It features the MC6809 processor, 6K of EPROM, 1K of RAM, 40 parallel I/O lines, 2 RS-232C

*Trademark of Motorola

serial ports, BREAK detect, 3 16-bit programmable timers, priority interrupt vector generator and a power failure protect/restart circuit.

For more extensive system requirements, the 9609 is supported by a variety of Memory, I/O, and Data Acquisition modules, and a broad line of card cages, power supplies, mother boards, prototype boards and accessories.

THE OEM ADVANTAGE

Try to find another set of microprocessor modules in the same price and quality range with all the positive features Creative Micro Systems has to offer.

Original Equipment Manufacturers who compared our products have specified Creative Micro Systems for applications in data

acquisition, data communication and encryption, materials testing, automatic test equipment, process control, energy management systems, agricultural instrumentation and small business data processing systems.

WANT MORE TO COMPARE

Once you compare you'll agree Creative Micro Systems has more to offer your application. Write or call for our new product catalog. We'll also be happy to tell you about our exciting new products in development now.

LUCIDATA PASCAL RELEASE 3
for 6800 and 6809 systems

If YOU need an easy-to-use, well proven implementation of Pascal, that doesn't need a mini computer to run it
LOOK NO FURTHER — WE SELL IT !

The LUCIDATA P.6800 Pascal System
NOW HAS ALL THESE FEATURES

- * All standard Pascal types are supported and full type-checking is performed.
- * REALLY fast 9-digit precision scientific functions
- * Allocation of variables to absolute memory locations allowing easy control of memory-mapped peripherals (eg video boards, ADCs etc.)
- * Fully optimised run-time system for each processor
- * Any number of external USER supplied routines may be easily linked to Pascal defined functions and procedure identifiers within your program
- * Fast compiler which generates our own ultra efficient P-code instructions
- * Multiple files which may be sequential/random disk files supported by your DOS, or physical devices added by you
- * Custom versions available to special requirements
- * All LUCIDATA Pascals come with a comprehensive User Manual PLUS lots of demo programs
- * Prices start at \$ 150

Write now for a full specification, price list and order form to :-

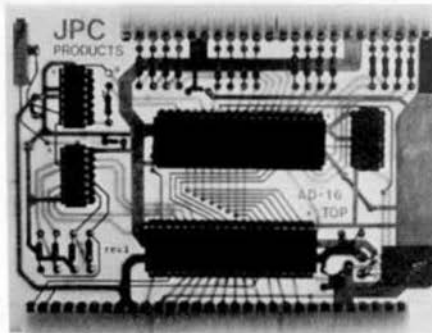

LUCIDATA Ltd.
P. O. Box 128
Cambridge
CB2 5EZ
ENGLAND

Purveyors of
Pascal since 1979

Release 2 of LUCIDATA's Pascal with the same high precision real arithmetic, but excluding scientific functions, is still fully supported and now available at reduced prices starting at only \$90 ! ! !

6809 HUMBUG!

The BEST 6800 monitor is now available for the 6809. Get the power of a 6809, but keep the friendliness and simplicity of the 6800 with HUMBUG-09.

HUMBUG-09 provides the common functions and commands of your present monitor, but adds full trace and debugging facilities. With it you can single-step programs, insert and keep track of multiple breakpoints, dump memory, abort and continue programs, and more. You can switch I/O ports during execution of a program, link to user-supplied I/O routines or video boards, even pause when the screen is full.

It has a very simple — yet new — way of handling the DAT that eliminates all hassles. Adding non-standard equipment such as disk controllers or video boards is easy and automatic. Makes the DAT work for you instead of against you.

Most important, HUMBUG-09 takes the mystery out of your 6809 system. It always does exactly what you expect it to — no unpleasant surprises. It's based on a year's user experience with 6800 HUMBUG.

The initial version is for systems using the SWTP MP-09 CPU board and less than 64K of RAM; it does not support the DMF-2 disk. (Alternate versions available, including video-based versions). The price of \$75 includes two ROMs, complete manual, and either full, commented source listing or source code on disk — you choose!

And here's an offer you can't refuse: If you buy our 6800 HUMBUG, we'll give you full trade-in credit when and if you decide to upgrade to HUMBUG-09. See our ad in last month's issue for our other fine 6800/6809 products, or send s-a-s-e. For information.

STAR-KITS, P.O. Box 209, Mt. Kisco NY 10549

DISCOVER THE 6809 IN YOUR COLOR COMPUTER!

Now you can explore the Radio Shack Color Computer's impressive potentials—as an inexpensive development system, a color peripheral, a process controller—ad infinitum. The Micro Works introduces these powerful software tools for utilizing the color computer at the assembly language level.

MONITOR TAPE: A cassette tape which allows you to:

- Examine or change memory using a formatted hex display
- Save areas of memory to cassette in binary (a "CSAVEM")
- Download/upload data or programs to a host system
- Move the video display page throughout RAM
- Send or receive RS-232 at up to 9600 baud
- Investigate and activate features of your computer, such as hi-res graphics or machine-language music
- Use your color computer as an intelligent peripheral for another computer, a color display or a 6809 program development tool

The monitor has 19 commands in all, and is relocatable and re-entrant.

80C Monitor Tape Price: \$29.95

MONITOR ROM: The same program as above, supplied in ROM. This allows BASIC to use the entire RAM space. And you don't need to re-load the monitor each time you use it. The ROM plugs into the Extended Basic ROM Socket or a modified ROMPACK.

80C Monitor ROM Price: \$39.95

INSIDE THE COLOR COMPUTER: This package is a disassembler which runs on the color computer and enables you to generate your own source listing of the BASIC interpreter ROM. Also included is a documentation package which gives useful ROM entry points, complete memory map, I/O hardware details and more. Disassembler features include cross-referencing of variables and labels; output code which can be re-assembled; output to an 80-column printer, small printer or screen; and a data table area specification which defaults to the table boundaries in the interpreter ROM. A 16K system is required for the use of this cassette.

80C Disassembler Price: \$49.95

SOFTWARE FOR PERCOM LFD-400

DIXIE a complete DOS package \$60

FEATURES: Dynamic allocation of disk space, 15 directory levels, 45 files per disk, 12 character names, Quick & easy conversion from MPX.
RESIDENT COMMANDS: Create, release, rename, protect/unprotect, save, load, and execute FILE (at specified directory level). Create, release, and rename DIRECTORY LEVEL. Print disk label & number of free sectors, Print directory report (at specified level). Jump to address.
UTILITIES: Convert MPX disk to DIXIE disk, list disk, Change disk label, Single/dual drive disk copy, File copy, Directory report to printer.
PATCHES: Percom SUPER BASIC, TOUCHUP editor, symbolic assembler, and HEXLDR, TSC cassette editor and assembler, SWTP 8K basic.
REQUIRES: MIBUG type monitor, MINIDOS 1.4, 800 words RAM.
YOU GET: 2708 EPROM, 3 disks with source for all software, Manual.

XREF a cross reference patch \$15

Adds symbol cross reference assembly option to the Percom assembler (base & DIXIE-modified versions). Source code supplied on disk. Manual.

See review of DIXIE and XREF in Nov. '80 issue of '68' MICRO and note that the Percom SUPER BASIC patch and the MPX-to-DIXIE disk conversion utility are both now completed and supplied with the DIXIE patch.

ANNOUNCING...

SUPER SLEUTH

A PROGRAM ANALYSIS &
DE-BUGGING TOOL

By
Edgar M. (Bud) Pass, Ph.D

\$99.00

SUPER SLEUTH

SUPER SLEUTH is a set of programs which enable the user to examine and/or modify binary program files on disk, or in memory. Programs may be disassembled into source code format and the source saved on disk. Labels produced by SLEUTH can be changed globally to labels of your own preference. Cross reference listings of labels can be produced to aid in debugging the program. Programs in ROM can be "altered" with the altered program being saved on a disk file. The resultant file can then be used to reprogram a new ROM.

- Object code for 6800, 01, 02, 03, 05, 08, 09 or 6502 can be processed.
- 6800, 02, 08, 09, object code easily converted to 6809 Position-Independent code
- 45 page detailed operating manual included
- Programs supplied in source form - Assembly required
- Available on 5" or 8" FLEX (TM) Disk for 6800 or 6809

Visa or Mastercard accepted

Combining pre-defined, internally-stored phoneme (speech sounds), any word in the English language (and most words in many other languages) may be generated! Programmable inflection allows natural-sounding speech! Speech rate and frequency may be varied to allow variable voice ranges!

Typically, only two to twenty bytes-per-second of phonetic data are needed to drive "THE SPEAKER". This low rate even allows almost any basic interpreter to talk through "THE SPEAKER" directly using PEEK and POKE statements! We even supply sample code to show you how!

Unlike other synthesis methods available, only about one to two bytes per letter in English words are needed to build the phonetic spelling of a word - "THE SPEAKER" does not take all of your RAM to store a message! Even basic DATA statements may be used to store speech messages in your programs!

This is NOT a kit! "THE SPEAKER" is completely assembled, tested and burned-in! When you receive it, you plug it in and go! No hardware construction means that even operators with no electronics experience can easily install and use "THE SPEAKER" voice synthesizer!

Our IBM-80 Color Computer version is designed to plug directly into the ROM-PACK slot and talk through your television - NO wiring necessary! The SS-30/30C (SS-80/80C I/O board) version requires only an external 4- or 8-ohm speaker (not provided) to be fully operational!

We even provide demonstration software (supplied on FLEX* 1.0, FLEX 2.0, FLEX-8, MINI-FLEX, DOS88 or DOS89 disk or COLOR BASIC cassette) and sample listings to allow you to quickly bring up "THE SPEAKER" on your system! We even provide a listing of common words to simplify the programming of your own custom messages!

If you are not convinced that "THE SPEAKER" is the best speech synthesizer available today and want to hear it talk before you buy, you may call our number between 9 PM EST and 8 AM EST. Our COMPUTER will automatically answer the phone for an actual demonstration of "THE SPEAKER" in action, and what it can do for you!

What more can we say?! "THE SPEAKER" Phonetic Voice Synthesizer SPEAKS FOR ITSELF. LITERALLY! Order yours TODAY! At this price, we believe that there is no better voice synthesizer available for any system at any price!

SS-80 VERSION (30-PIN I/O BOARD) \$229.95
TR8-80 COLOR COMPUTER VERSION \$179.95

We accept VISA, MASTERCHARGE, UPS C.O.D.'s, checks. No open account orders accepted, except to our established customers. Orders pre-paid by checks payable in U.S. FUNDS ONLY! Va. residents add 4% sales tax. Overseas orders add \$15 for shipping and handling. Continental orders shipped pre-paid. Delivery is from stock to 30 days. Checks may require mailing longer. Dealer and OEM discounts are available.

MICROPRODUCT BULLETIN

Why SSB?

Let's face it, some of you just don't know who Smoke Signal Broadcasting is and what we provide for the 6800, 6809 and SS-60 user. This bulletin will be the first in a monthly series appearing in this magazine, and for starters we'd like for you to get familiar with us.

The Products. Since 1977, we've been designing, developing and manufacturing microcomputers — and associated products — based on Motorola's 6800 and 6809, and configured to the SS-60/SS-60C Bus.

Our **CHIEFTAIN** Series of microcomputers range over a broad span of configurations to fulfill any capacity need. The **CHIEFTAIN 822** is a 8 1/4-inch dual drive/dual density 6800-based system with 32K RAM (expandable). It's priced at only \$3498.00.

The 924 is a dual 8 1/4-inch octodensity 6809-based system with 1.8 Mbytes of disk storage, priced at only \$4028.00.

A **CHIEFTAIN 9822** is the dual 8-inch double-sided dual density computer system, taking full advantage of the 6809, priced at a mere \$4678.00. Eight-inch Winchester computer

systems are also available in either 10 Mbyte (98W10) or 30 Mbyte (98W30) storage configurations.

The Hardware. All of our boards and complete systems are **Endurance Certified** to completely assure you of the latest in industry-standard and state-of-the-art technology. Our DCB-4 Double Density Controller Board (\$449.00) became the Standard Controller Board for the 6800 and 6809, handling up to four 8 1/4-inch and four 8-inch drives simultaneously. Smoke Signal provides the most innovative solutions for the 6800/6809 SS-60 Bus structure that money can buy.

The Software. Five operating systems (including FLEX and OS-9 Multi-User) are running on

the **CHIEFTAIN** Series with NO configuration problems. SSB DOS680D and DOS69D (each \$79.00) were developed in-house and have become leading standard operating systems.

Smoke Signal provides Business Application Software to fulfill all vertical needs of the businessperson who is automating.

Our systems software, in conjunction with our DOS, will accomplish any task from text editing and processing up to our Super MACRO-ASSEMBLER that will produce code for every Motorola 6800/6809 family of processors available.

OS-9 Level One and Level Two are the new multi-user and multi-tasking operating systems that will make the 6809 reach the highest potential. COBOL, FORTRAN, Random File BASIC, Pascal, PORTH, and SDBASIC (compiler) are all available for the **CHIEFTAIN**.

Convince Yourself:

Prices. SSB does not sacrifice quality for low cost. The **CHIEFTAIN** Series of computers are **not** expensive, yet are the absolute best 6800 or 6809 computers you can buy!

SOME OF OUR PRODUCTS:

CHIEFTAIN 822	\$3498.00
CHIEFTAIN 922	3828.00
CHIEFTAIN 924	4028.00
CHIEFTAIN 822	4875.00
CHIEFTAIN 9822	4678.00
CHIEFTAIN 98W10	8698.00
CHIEFTAIN 98W30	9995.00
M-16-X (16K RAM)	299.00
M-24-X (24K RAM)	439.00
M-32-X (32K RAM)	539.00
DCB-4 (includes DOS)	449.00
VD8-1 Video Board	395.00
LMB-1 Motherboard	229.00
SSB DOS (68D or 69D)	79.00

All **CHIEFTAINS** come standard with 32K of RAM; Two Serial I/O Ports; SSB DOS68D or 69D; two disk drives; 6800 or 6809 CPU; a DCB-4; cables; power supply and LMB-1 Motherboard. All connectors are gold-plated. You receive complete and accurate manuals with every product.

Smoke Signal Broadcasting provides support. We will stand behind every product that goes out the door, and you can hold us to that. We realize that this is a time when other manufacturers are playing number games, and forgetting quality for the sake of quantity. Ask any SSB user about our factory support. If that doesn't convince you, **nothing** will!

Why Smoke Signal Broadcasting? Because we're the best. We produce state-of-the-art 6800 and 6809 products for the SS-60 Bus that are not headaches ... that will not require carrying a screwdriver around ... and that are efficient, fast, productive and reliable computers.

Smooth™ Software

Modern Program with Disk File Transfer (Instructions and Source Listing) 30.00
Disk with source and object code add 10.00
Specify 6800 or 6809, SSB or FLEX™, 5" or 8" for only \$45.00

ALL IN ONE

Editor - Text Processor - Mailing Labels
Mailing Lists - Use any CRT terminal and printer

Supports Editing commands such as bottom, change, delete, find, insert (single line), input (multiple lines), list, next, overlay (with cursor editing, character deletion and insertion), overstrike (not selected darker text), Print, restart, set, top, underline, up, and verify.

Supports Test Processing commands such as block copy, block move, centering, margin justification (wide and narrow), paging, and tabbing.

Mailing Lists and Labels. Use the same mailing list disk file (with protected areas) for both mailing labels and letters. Letters are personally addressed to each person or selected persons on the mailing list.

Most Powerful File Handler found in any editor. Append one file to the end of another, or insert (merge) one file into another as designated by the line pointer. Print specified lines to your printer or to a disk file. Edit files larger than the text buffer. Does not produce output files when not desired. Delete disk files from the editor.

Printer commands. Control characters can be sent to the printer for format control either directly from the control terminal or by embedding them in the text. The set command contains interface initialization and character output routines to support the SWTPC MP/C interface as well as the standard serial and parallel interfaces. Jumps are also provided to user supplied printer routines. User selects the port address (C thru Z, A or B) thereby eliminating the need for the user to install printer software routines. Editor can be initialized for either 4 or 16 addresses per port.

Editor allows exiting to either the monitor or DOS and then reenter (Warm Start) without destroying previously prepared text in the buffer. The Restart command erases contents in the buffer without the user having to reedit the Editor.

The Editor allows the user to toggle between full duplex (no echo) and half duplex (echo) as needed. It responds to commands in both upper and lower case and can be used to create assembler, source code and Basic programs as well as text.

32K S-100 EPROM CARD

NEW!

\$74.95
KIT

USES 2716's

Blank PC Board - \$34

ASSEMBLED & TESTED

ADD \$30

SPECIAL: 2716 EPROM's (450 NS) Are \$11.95 EA. With Above Kit.

KIT FEATURES:

1. Uses +5V only 2716 (2Kx8) EPROM's
2. Allows up to 32K of software on line!
3. IEEE S-100 Compatible
4. Addressable as two independent 16K blocks
5. Comemco extended or Northstar bank select
6. On board wait state circuitry if needed
7. Any or all EPROM locations can be disabled
8. Double sided PC board, solder-masked, silk-screened.
9. Gold plated contact fingers
10. Unselected EPROM's automatically powered down for low power
11. Fully buffered and bypassed
12. Easy and quick to assemble.

FOR 4MHZ
ADD \$10

KIT FEATURES:

1. Addressable as four separate 4K blocks
2. ON BOARD BANK SELECT circuitry. (Commemco Standard). Allows up to \$12K on line!
3. Uses 2114 (450NS) 4K Static RAMs
4. ON BOARD SELECTABLE WAIT STATES
5. Double sided PC Board, with solder mask and silk screened layout. Gold plated contact fingers
6. All address and data lines fully buffered
7. Kit includes ALL parts and sockets
8. PHANTOM is jumpered to PIN 67
9. LOW POWER under 1.5 amps TYPICAL from the +5 Volt Buss
10. Blank PC Board can be populated as any multiple of 4K.

NEW! S-100 SOUND COMPUTER BOARD

At last, an S-100 Board that unleashes the full power of two unbelievable General Instruments AY-3-8910 NMOS computer sound IC's. Allows you under total computer control to generate an infinite number of special sound effects for games or any other program. Sounds can be called in BASIC, ASSEMBLY LANGUAGE, etc.

KIT FEATURES:

- TWO GI SOUND COMPUTER IC'S.
- FOUR PARALLEL I/O PORTS ON BOARD.
- USES ON BOARD AUDIO AMPS OR YOUR STEREO.
- ON BOARD PRATO TYPING AREA.
- ALL SOCKETS, PARTS AND HARDWARE ARE INCLUDED.
- PC BOARD IS SOLDERMASKED, SILK SCREENED, WITH GOLD CONTACTS.
- EASY, QUICK, AND FUN TO BUILD. WITH FULL INSTRUCTIONS.
- BASIC PROGRAMMED I/O FOR MAXIMUM SYSTEM FLEXIBILITY.

Both Basic and Assembly Language Programming examples are included.

SOFTWARE:

SCL™ is now available! Our Sound Command Language makes writing Sound Effects programs a SNAP! SCL™ also includes routines for Register-Examine-Modify, Memory-Examine-Modify, and Play-Memory. SCL™ is available on CP/M™ compatible diskette or 2708 or 2716. Diskette - \$24.95, 2708 - \$19.95, 2716 - \$29.95. Diskette includes the source. EPROM's are ORG at E000H.

SUPER
ENHANCED
DBM II

This is a comprehensive group of programs that allows a virtually untrained person the ability to store and recall vast amounts of information in a computer system to meet their individual requirements.

The user is guided through these extensive programs by Menus and Sub-Menus. By simply answering prompts, the user can create files, sort any type of data and recall or manipulate it at will. The size of the files is only limited by the disk storage capacity of the system.

Sub records of related information can contain as many as 27 different fields of information and can contain either alphanumeric, integer or floating point data.

The software is written in *TSC Extended Disk Basic utilizing well commented structured programming techniques. Custom Programs can be created quickly through the sub-routine library.

*FLEX AND UNIFLEX ARE TRADEMARKS OF TECHNICAL SYSTEMS CONSULTANTS.

DM-64

64K 2MHZ Memory Board

All Boards
Tested at 2.5 MHZ

The DM-64 is a 64K dynamic memory board which operates at 2 megahertz with fully transparent refresh. This is accomplished with a proprietary memory control design unlike any other. The board appears to the bus as a 64K static memory. All addressing options are made by DIP switch selection. This board sets the pace in state-of-the-art memory design and is backed by a ONE YEAR FACTORY WARRANTY.

COMPARE THESE FEATURES!

- | | |
|--|--|
| <ul style="list-style-type: none"> • Fully Transparent Refresh • Conforms to ALL bus timing and loading • Full 20 bit addressing • SS-50 or SS-50C operation • 6800, 6809 compatible • Individual disable on each 4K segment | <ul style="list-style-type: none"> • Each board exhaustively tested and burned-in • Low power consumption • Gold bus connectors • Fully socketed • Industrial Quality Components and Construction • Full 2 MHZ operation |

Model EP-2A-88 EPROM Programmer

Fast as Jackrabbits... Well, almost!

In Australia, two rabbits can reproduce over 13 million offspring in 3 years... at 105 seconds for 2706's, the EP-2A-88 can reproduce 1892.160 EPROMS in 3 years. Single push button control, the EP-2A-88 checks if EPROMS are erased, programs and verifies. It also checks for defective EPROMS.

Two basic models are available. The EP-2A-88-1 will accept Copy (CM) modules for the 2758, and 2716 EPROMS. The EP-2A-88-2 will accept copy modules for the 2716, 2732 and TMS 2532 EPROMS. Power requirements are 115 VAC 50/60 Hertz at 15 watts.

Part No.	Description	Price
EP-2A-88-1	EPROM Programmer	\$490.00
EP-2A-88-2	EPROM Programmer	490.00
CM-50	Copy Module for 2716, TMS 2516 EPROMS	25.00

DYNASOFT PASCAL 1.2

DYNASOFT PASCAL is a portable p-code implementation of a Pascal subset designed for cassette-based 6800/6809/6502 systems with at least 12K of available RAM.

DYNASOFT PASCAL includes the control structures of standard Pascal and the data types INTEGER, CHAR, BOOLEAN, SCALAR, SUBRANGE, POINTER and ARRAY. Version 1.2 now supports heap management using the standard procedures NEW, MARK, and RELEASE, and has a re-designed table-driven I/O system which permits adaptation to a wide range of peripherals, including disk. Its one-pass compiler produces compact ROMable p-code, and the 1.5K run-time interpreter can be supplied separately in ROM for dedicated controller applications.

The complete system is available for commercial users with interpreter source code and license for \$85. Personal/hobby users may obtain the cassette and users manual only for \$45, including air mail postage. Quantity pricing available on request. Check, money order, and VISA accepted.

F & D PRESENTS TWO GREAT VITRO BOARDS

PRO-1 - A CPT controller board for the S50 bus. Built around Motorola MC6843 programmable CRTC chip. Many display formats possible; 32 X 16, 64 X 16, 82 X 16, 80 X 24, etc. Up to 4k memory. Light pen input. User PIA port. Variable scrolling, by character, by line, by page. Programmable cursor with various formats. Upper case, lower case, and graphics character sets. Graphics or user-defined characters stored in 2708 or 2716 EPROM for versatility. Screen format can be dynamically changed during program execution. Setup routines and demo software listings provided. Much software available - BASIC patches, Monitor EPROM programs, etc. Programmed graphics EPROM available.

PMB-1 Bare Board and Documentation \$37.50

CVM-1 - A color Alpha/Graphics board built around the MC6847. S50 compatible. Variable addressing and bank select. Up to 3k memory. On board PIA, one port for user, other optionally controls 6847 modes. Full graphics or mixed alpha and semi-graphics. Up to eight colors. Software driver listing provided.

CVM-1 Bare Board and Documentation \$35.00

IMAGINE THE ULTIMATE 6800 SYSTEM

IMAGINE

Imagine if you tried to design the ULTIMATE 6800 Computer system!

You know that compatibility with existing software and operating systems is the single most important requirement in your design. You decide early in your plan that ability to easily run operating systems such as FLEX, PASCAL, MTS, and FORTH is a priority item. Along with compatibility, you also decide that you want to provide the highest possible level of computing performance.

RESULTS

For many of your users, a convenient and attractive package will be as important as the stuff that's inside. Your ultimate 6800 system will have to be more than a collection of modules, boxes, and power supplies if it is going to serve users who want Results as much as they want technology.

Your ultimate 6800 system won't forget OEM'S and Systems Houses either. Real-world applications usually call for modularity, adaptability and flexibility. You want to make sure that your ultimate 6800 system has both RS-232 serial interfaces and parallel input-output. If possible the system will provide space and power for custom circuitry inside the main enclosure.

As you spend endless hours thinking and planning the ultimate 6800 system, one question keeps coming up, time and time again: how can you include all of these wonderful features in the system and still keep the cost down so that low price will be a benefit, too?

A BREAKTHROUGH

One night you wake up and suddenly know the answer! The answer is to put your ultimate 6800 Computer in the same box with a high-quality, human-engineered keyboard/display. That way you can save the expense of separate boxes and make a product which really is the ultimate 6800 system. By choosing a terminal design that incorporates microprocessor control, full-function keyboard and high-resolution characters you can add the benefits from hundreds of thousands of development dollars to your design and still have the best price/performance in the industry.

THE WAVE MATE 2000

What you have done is design the Wave Mate 2000, truly the ultimate 6800 Computer system. This compact and attractive Computer takes up no more space than an office typewriter, yet has the power of a full-blown system. It's more than just another pretty face, too. Everything inside the two-tone grey enclosure is built for long life and high performance.

You can't help but feel that the 21st Century has really arrived when you start the system just by turning on the power and sliding in a disk. Within a second or two a beep comes from the annunciator, telling you that the Z-80 keyboard-display controller has found itself in good working order. A few moments later a second beep announces that the 6800 CPU has successfully tested all 64K of memory. The disk drive loads your system in seconds, and you're on your way!

Whether you have a disk drive in your main Series 2000 enclosure or have all of your disks outboard, you can still have up to 2.8 megabytes of dual-density 5.25 inch floppy disk storage...or as little as 180K bytes. And if you need more storage, there's a Winchester waiting just for you.

From the 72-key keyboard with special function keys and separate numeric keypad to the 7x9 matrix characters on the 12-inch display screen, the Wave Mate 2000 gives you the feel of a machine that can handle just about any job well. Should your special application require it, you can program up to 21 different special functions to operate with a single keystroke. If you want Graphics, you make graphics. If you want Reverse Video, you reverse it. If you want Cursor Addressing, you address it. Easy, clean, and carefully thought out.

DID WE MENTION PERFORMANCE?

The performance of a plain old 6800 system isn't bad. The performance of the Series 2000 is TWICE AS GOOD in just about every way you can imagine. For one thing, the clock is twice as fast, at 2 megahertz, which makes the instructions run twice as fast. Memory, all 64K of it, is fast enough to keep up with computation with no waitstates or other kinds of fudging, which means that memory is at least twice as fast. For another thing, the disk transfer rate is twice as fast, because disk storage format is Double Density, which gets your software into and your results out of your Series 2000 Computer twice as fast. Having an extra CPU around to manage the keyboard/display helps performance, too, because the 6800 CPU doesn't have to worry about communications house-keeping. Communications with the console keyboard/display and the two RS-232 interfaces is handled in the most efficient possible manner...under Interrupt Control.

WE DO NOT FORGET THE OEM

Little things inside the Series 2000 Computer exist for the pleasure and convenience of those special people who do not simply use Computers but take them, make them into special forms, and then pass them on to others who use them as timesavers, as helpers, and as tools for

profit. Among these little things are I/O interfaces, right inside the machine, which permit attachment of 3 physical and 11 logical devices to the very innards of the Series 2000 Computer. Through these connections the Series 2000 Computer may control, measure, test, time, start, stop, or merely converse with almost anything.

WHAT MORE CAN ONE SAY?

A lot more can be said about this excellent product, because it truly is the ultimate 6800 system. At least four major operating systems are up on the Series 2000 Computer and a lot of useful software runs under the operating systems. Systems begin at \$3195, with substantial discounts for quantity purchases.

Call us at (213) 644-0113 or write us at our Hawthorne, California address and we will send you what you need to know about the Wave Mate 2000. We are building a Dealer Network for the Series 2000 and welcome inquiries from competent firms.

If you need M68000, Z8000, or 8086 Software, take it off our shelf.

Why wait up to 6 months for high quality 16-bit resident system software, when you can get it now?

Hemenway Associates can give you the software tools you need to get the most out of your 16-bit hardware. Because 8086, Z8000 and 68000 Systems Software is sitting on our shelves right now.

Single user operating systems, macro assemblers, text editors, floating point packages, multi-tasking operating systems, linking loaders and PASCAL compilers are all ready for immediate delivery.

You've heard about Hemenway Associates' system designs in the pages of EDN. But now you can have Hemenway-

designed software for your 16-bit micro-processor. Our software is easily adaptable to any hardware configuration. From manufacturers evaluation boards to full-blown microcomputers. It's efficient, easy-to-use and backed by ongoing support.

So whether you're a microcomputer manufacturer, software developer or individual microcomputer owner, Hemenway has the software for you.

For the hard facts on Hemenway software, write or call: Hemenway Associates, 101 Tremont Street, Boston, Massachusetts 02108. Phone: 617-426-1931. TWX 710 321 1203. TELEX 921735.

HEMENWAY ASSOCIATES, INC.

When it comes to software, come to Hemenway.

SOFTWARE...

MSI has MORE!

**WE INVITE YOU TO LOOK AT OUR NEW SOFTWARE CATALOG
WHICH OFFERS NEW PROGRAMS FOR YOUR 6800 SYSTEM.**

•All FLEX™ Programs from TSC are now available for MSI Computer Systems.

•MULTI-DISK FLEX™ from MSI allows the use of any combination of MSI disk devices to be used simultaneously, including the HD-8/R 10 megabyte drive.

•SORT/MERGE Program can be used manually or within other BASIC or assembler programs to perform high speed sorts of data files.

•Hemenway Associates Software Products for use under FLEX™ are available on the MSI System.

•TRS-80/MICROSOFT BASIC - MSI BASIC Translator allows MSI users to run the large library of basic programs written for the TRS-80 and other similar systems.

•SOFTWARE LIBRARY Programs keep track of all diskette and hard disk directories, giving alphabetical listings of available programs.

•SDOS Operating System.

•MULTI-USER/MULTI-TASKING SDOS Operating System allows any user to perform edits, assemblies, compilations, or program executions independently and simultaneously.

•All MSI software is supported on four (4) disk systems: quad density minifloppy, single and double density 8" floppy, as well hard disk systems.

•Complete BUSINESS APPLICATION PACKAGES including sales order entry, accounts receivable, inventory management, purchase order entry, accounts payable, and general ledger are available on MSI hard disk systems.

•PLOTting PACKAGE gives daisy-wheel printers the capacity to perform graphics operations.

•LETTERWRITER Word Processing Software allows the use of daisy-wheel printers to generate documents and to handle correspondence automatically.

DYNAMITE™

"THE CODE BUSTER"
DISASSEMBLES 6800 & 6809 MACHINE CODE
INTO BEAUTIFUL SOURCE

- Convert your 6800 programs to 6809!
- Automatic LABEL generation
- Allows specifying FCB's, FCC's, FDB's, etc.
- Constants input from DISK or CONSOLE
- Automatically uses system variable NAMES
- DISK-to-DISK or DISK-to-CONSOLE operation
Includes 5" or 8" FLEX 9 diskette with relocatable object code. Full operating instructions (you'll learn in minutes!)

Order your DYNAMITE™ today
Only \$60.00 postpaid in U.S. MC & VISA accepted
6809, FLEX 9, and 24K total RAM required
order from:

COMPUTER SYSTEMS CENTER

13461 Olive Blvd.
Chesterfield, MO 63017
(314) 576-5020

we also stock SWTPC, TSC, JPC products
Hours 10A.M. to 6P.M. Mon. thru Fri.

Dealer inquiries welcome

6809 POWER

DATA MANAGEMENT SYSTEM - DMS2/VM

- Virtual memory technology - databases to 1000K
- User defined hierarchical files to 12 levels
- Alpha, Numeric, Decimal, Integer & Coded fields
- Fast fixed point BCD arithmetic to 16 digits
- Select, Sort and Key Access on multiple fields
- CRT Inquiry and formatted reports with totals
- Simple High-level Command language interface
- Accommodates majority of business applications
- Written in highly efficient modular assembler
- Runs on SWTPC 6809 56K+ with 8" disk, FLEX O/S
- Commercial Quality and easy to use.....\$650.00

DATA MANAGEMENT SYSTEM DMS1

- Entry level system - allows databases to 32K
- Same as above but w/o virtual memory...\$250.00

Also Available:

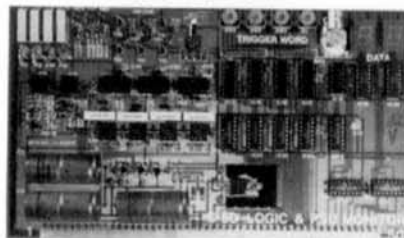

BASIC ACCOUNTING SYSTEM for DMS2/VM

- Point-of-sale option, User defined transactions,
 - Inventory, Accts Rec & Pay + much more...\$350.00
- Basic Accounting System for DMS1.....\$150.00

WINDRUSH MICRO DESIGNS LTDs INTRODUCING OUR S-50 MONITOR

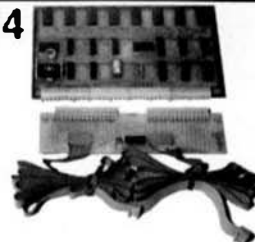

- ★ MONITORS ALL THREE UNREGULATED SUPPLY RAILS. ADJUSTABLE TRIP THRESHOLDS.
 - ★ SEQUENCES NMI, MRS, UD1 ON POWER UP AND POWER DOWN. PROTECTS NON-VOLATILE MEMORY, DISC SYSTEMS, AND INITIATES CONTROLLED SHUTDOWN OF THE SYSTEM.
 - ★ FLASHING LOW MAINS (BROWNOUT) WARNING ON UD2.
 - ★ LOGIC MONITOR IS FULLY BUFFERED.
 - ★ WORD TRIGGER SET UP ON FOUR HEX - DEC SWITCHES.
 - ★ DATA IS DISPLAYED AND LATCHED.
 - ★ BNC CONNECTOR FOR TRIGGER OUTPUT
- \$120.00 ALL INCLUSIVE, DOMESTIC OR FOREIGN,
ACCESS/VISA/MASTER CHARGE/INT'L MONEY ORDERS.

WE DESIGN AND MANUFACTURE 68XX COMPUTER SYSTEMS TO INDIVIDUAL REQUIREMENTS. WE ARE ALSO DISTRIBUTORS OF THE ENTIRE RANGE OF SMOKE SIGNAL BROADCASTING EQUIPMENT.

GAYMERS WAY INDUSTRIAL ESTATE,
NORTH WALSHAM, NORFOLK, ENGLAND.
TEL: 06924 5189
TLX: 975212

★ CT-64 CT-1024

★ DMA VIDEO ADAPTER FOR YOUR TERMINAL

- DMA (ability to update anyplace on the screen directly)
- HIGH SPEED DISPLAY (fast as any video board)
- KEYBOARD CONTROL (of baud rate and paging /scrolling)
- DOCUMENTATION (includes source listing that replaces Oulee)

J.B.I. adapter with memory \$142.50, J.B.I. adapter without memory \$129.50. Source Code on Disk \$5.00 — Tape \$3.50

Provide your system configuration and software.
Terms: cash, MC, Visa or C.O.D. plus \$3.50 shipping and handling.

THOMAS INSTRUMENTATION

THE MACHINE TOOL, INDUSTRIAL SPECIALISTS IN BUSINESS ON A FULL TIME BASIS FOR 10 YEARS

NEW PRODUCT:

S-R/R

48K 2MHz STATIC RAM/ROM CARD

- *24 2K blocks memory mapped on any 2K boundary
- *uses low power 2016P-2 (2128) RAM and/or 2716 ROM
- *mix 4K blocks of RAM and ROM
- *6800 and 6809 compatible
- *use on SS-50 and SS-50C buss
- *decoded for extended addressing
- *5 volts only
- *low power consumption (typ. 1/2 amp with 48K RAM)
- *gold connectors

Special introductory prices for all orders placed before July 1, 1981 — Regular price will be 20% higher.

Bare board \$39.20 2716 \$12.80 2016P-2 \$13.60
A/T without memory chips \$100.00
A/T with 16K \$220.00; with 32K \$316.00; with 48K \$440.00

NEW ACCESSORIES FOR 68XX USERS:

SS-50/SS-50C EXTENDER CARD \$35.00
SS-30 EXTENDER CARD \$25.00
*Both cards assembled with a built in logic aid & gold edge connectors
SS-30 WIRE-WRAP/PROTOTYPE BOARD (board only) \$20.00
*Pad spacing permits most standard sockets from 8 to 64 pins
*Provision has been made for voltage regulators

FEATURED PRODUCT: SP-1 Bare card \$49.00 Asm. + tested \$195.00

*A super prototype board *Card design includes

(3) 6821 6 parallel ports
(4) 6850 4 serial ports
(1) 6840 3 16 bit counter/timers

which are fully buffered and decoded

*Accommodates a mix of 38, 14 & 16 pin wire wrap sockets

*Pad spacing permits most standard sockets from 8 to 64 pins

MODEM CARD	B/C	\$ 49.00	
special parts kit		\$195.00	A/T with extra features \$395.00
A/T without extra features		\$325.00	Software obj. & src. on FLEX disk \$ 10.00
*SUPER CPU assembled with source listing			BACKPLANES AND MOTHERBOARDS
without 2K EPROMS (2-2708)		\$235.00	*16 position SS-50 \$80.00
*Monitor in two 2708 EPROMS		\$ 29.00	*12 position SS-50 \$60.00
*CPU bare card, doc., & src.		\$ 59.00	* 8 position SS-50 \$40.00
*VIDEO RAM asm. 7x9 chars 64x16		\$195.00	* 6 position SS-50 \$30.00
*VIDEO RAM bare, doc, Xtal, src.		\$ 49.00	* 4 position SS-50 \$20.00
*PARALLEL I/O asm 100 I/O lines			* 8 position SS-30 \$39.00
incl. 5 PIA's for 10 ports		\$139.00	
*PARALLEL I/O bare card & doc.		\$ 49.00	**Connectors:
*SS-50 WIRE-WRAP/PROTOTYPE bare		\$ 39.00	GOLD \$1.60 ea. (M or F)
*TRANSITION CARD asm.		\$ 95.00	TIN M \$.40 ea. F \$.50 ea.
*TRANSITION CARD bare		\$ 49.00	

DEALERS FOR SWIPC, GIMIX, AND TSC

*All Thomas Instrumentation's cards come with full documentation including software source listings where applicable *All assembled cards are burned in at 150F and fully tested with Gold conn. *Bare card prices do not include edge connectors
*See previous ads, write, or call for more detailed information.

GIMIX 6809 CPU BOARDS for the SS-50 BUS

The GIMIX 6809 PLUS CPU is an extremely versatile board that offers the user a great many features and options which make it an ideal choice for a variety of systems and applications.

- ♦ All FPLA decoded devices can be individually enabled/disabled
- ♦ FPLA decoded devices are available for DMA access
- ♦ Extended addressing for the FPLA decoded devices (can be disabled)
- ♦ Software switching between on and off board system monitors using extended addressing
- ♦ Jumper selectable interrupts for the 6840, 58167, and 9511A/9512
- ♦ Any one of 3 memory management techniques can be used:
 - Straight Bank Select
 - GIMIX Enhanced DAT w/software write protect (optional)
 - SWTPC compatible DAT (required for SBUG-E) (optional)
- ♦ Software write protect in 4K blocks, of the entire address space (when GIMIX enhanced DAT is installed)
- ♦ Jumper selectable processor clock speeds (1, 1.5, 2 MHz.) (2MHz CPU optional)
- ♦ Separate buffers for the 6809 and the on card devices

- ♦ NMI input can be jumpered to the bus or to an external connector
- ♦ BA & BS jumper selectable for independent or gated operation
- ♦ User defined latch output
- ♦ Gold MOLEX connectors for trouble free contact
- ♦ SS-50 and SS-50C compatible
- ♦ Full DMA capabilities (works with any of the 6809 DMA methods)
- ♦ Full Slow memory capabilities
- ♦ Fully assembled, tested and burned in

NOTE: The GIMIX 6809 CPU BOARDS do not include a baud rate generator. In systems that require a baud rate generator, it must be provided elsewhere. The GIMIX 6800/6809 mainframe includes a baud rate generator on the mother board.

- ♦ 4 PROM/ROM/RAM sockets for monitors and user software (up to 32K)
- ♦ PROM/ROM/RAM sockets individually jumper selectable for single or multiple supply voltage and 1, 2, 4 or 8K byte devices
- ♦ 1K bytes of scratchpad RAM (optional)
- ♦ 6840 programmable timer with provisions for external clock, gate and output connections
- ♦ Time of Day Clock (58167) w/Battery backup (optional)
- ♦ 9511A or 9512 Arithmetic Processor w/Jumper selectable 2, 3, or 4 MHz clock speeds (optional)
- ♦ FPLA address decoding for the 8 on card devices 4 PROM/ROM/RAM sockets, 58167, 9511A/9512, 6840, 1K scratchpad RAM
- ♦ Software switching of address configurations for the 8 on card devices (allows software switching between on board PROM/ROM/RAM resident system monitors)

GIMIX inc.

The Company that delivers
Quality Electronic products since 1975.

1337 WEST 37th PLACE, CHICAGO, IL 60609
(312) 927-5510 • TWX 910-221-4055

Phone, write, or see your dealer for details and prices on our broad range of Boards and Systems for the SS50/SS50C bus and our AC Power Control Products for all computers.

6809 PLUS CPU #05 (With Time of Day Clock and Battery Backup Option Installed) \$548.05

The GIMIX 6809 PLUS CPU board has a variety of other options that may be ordered at the time of purchase or added later. It is fully socketed to allow adding the following options at any time.

- 2 MHz 6809 \$ 25.00
- GIMIX ENHANCED Dynamic Address Translation \$ 35.00
- SWTPC Compatible DAT (required for SBUG-E) \$ 15.00
- 1K NMOS Scratchpad RAM \$ 11.80
- 1K CMOS Scratchpad RAM w/ Battery Backup \$ 45.00
(#05 Board Only)

ARITHMETIC PROCESSORS

- 9511A (32 bit math w/transcendentals) 4 MHz \$312.00
- 9512 (64 bit math only) 3 MHz \$265.00

SYSTEM MONITORS FOR GIMIX 6809 CPU BOARDS

GMXBUG 09 is available for all versions of the GIMIX 6809 CPU BOARD. GMXBUG 09 includes advanced debugging capabilities, as well as utility and memory manipulation routines. It is available in both terminal and video based versions. The terminal based version is 2K long and requires a standard ASCII serial terminal. The video based version is 3K long and requires a GIMIX 80 x 24 VIDEO BOARD and a parallel ASCII keyboard. The terminal version can be upgraded to video based by adding the extra 1K PROM, without modification to the original 2K terminal version.

GMXBUG 09 6809 System Monitor (Terminal Based) \$ 98.65
Includes PROMS, Manual and Source Listing.

Bootstrap PROM \$ 30.00
(for GIMIX and SWTP 5 1/4" Disk Systems)

Video PROM for GMXBUG 09 (Includes Bootstrap) \$ 30.00

GMXBUG 09 Manual and Source Listing Only \$ 38.62

(GMXBUG 09 does not require a Dynamic Address Translator. However, it can be used with your choice of either GIMIX or SWTPC DAT. Please specify version desired when ordering.)

(GMXBUG 09 requires the 1K Scratchpad option on the CPU board. The price for GMXBUG 09 includes the 1K NMOS RAM option when ordered with the CPU)

To Substitute CMOS RAM with the above Add \$ 33.20
(#05 CPU Only)

MICROWARE'S DS9 and SWTPC SBUG-E monitors are also available, contact GIMIX for information and pricing.

FINALLY

We've talked about it.
Now, here it is.

Low power - only 30 watts
Quiet - no fans, brushless motor
Incredibly small - like minifloppy
Fast - step rate 1.5 mSec or better
- rotation 3800 rpm

NEW DISK 512 formatting program

- High-performance 512-byte/sector disk formats.
- All UCSD software is packaged on a single 8" diskette, no more CSI-1, -2, -3.
- User-group software available free on written request with order.

HARDWARE SUPPORTED:*

GIMIX 6809 CPU
GIMIX 5/8 CONTROLLER
SWTPC 6809 CPU
SSB 6809 CPU
SWTPC DC3 5 1/4"
SWTPC DC2 5 1/4"
SSB DCB-4 8"
SSB DCB-4a
SWTPC DMAF-1 8"
SWTPC DMAF-2 8"
SWTPC 14" WINCHESTER
TALLGRASS 5 1/4" WINCHESTER
SSB BFD-68 8"

*Requires 56k of memory, 6809 CPU.

HOW TO ORDER: PRICE \$459 US

Prepaid orders only.

Written orders preferred.

VISA & MasterCard acceptable.

Overseas orders add \$20 US
for extra postage and handling.

7623 W. 86th St.

SOFTWARE FOR THE HARDWARE

We know you hardcore bit hackers will recognize the computing power derived from combining the FORTH language with the 6809, today's most advanced 8 bit microprocessor.

And we know you'll understand this machine's 16 bit math, indirect addressing and two stacks are ideally suited for implementing FORTH.

But...should anyone need further convincing that FORTH provides a new dimension in power, speed and ease of operation, consider the following:

- It's a modern, modular, structured-programming high-level compiled language.
- It's a combined interpreter, compiler, and operating system.
- It permits assembler code level control of machine, runs near speed of assembler code, and uses less memory space than assembler code.
- It increases programmer productivity and reduces memory hardware requirements.

- It replaces subroutines by individual words and related groups of words called Vocabularies. These are quickly modified and tested by editing 1024-character text blocks, called screens, using built-in editor.

tFORTH is a basic system implemented for SS-50 buss 6809 systems with the TSC FLEX 9.0 disk operating system. It is available on 5¼" or 8" single density soft-sectored floppy disks. **\$100.00**

tFORTH + consists of tFORTH plus a complement of the following FORTH source code vocabularies: full assembler, cursor controlled screen editor, case statements, extended data types, general I/O drivers. **\$250.00**

firmFORTH is an applications package for use with tFORTH. It provides for recompilation of the tFORTH nucleus, deletion of superfluous code and production of fully rommable code. **\$350.00**

Call or write today.

Also available for 6800
